Master

Embedded Systems and Computer Security

ISAE

Rodolphe Ortalo

CARSAT Midi-Pyrénées (rodolphe.ortalo@free.fr) rodolphe.ortalo@carsat-mp.fr http://rodolphe.ortalo.free.fr/ssi.html

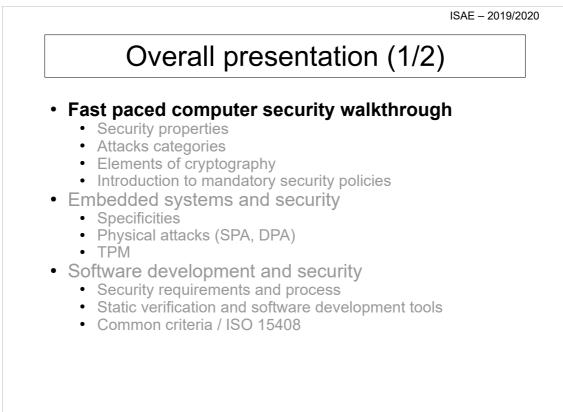

Overall presentation (2/2)

- · Case studies
 - Wireless networks
 - Next generation avionics systems
 - Network appliances
 - Mobile telephony
 - Gaming devices

• Wrap-up (if time permits)

- ibs
- Firewalls
- Tripwire
- Metasploit
- Anti-virus

A wide perimeter

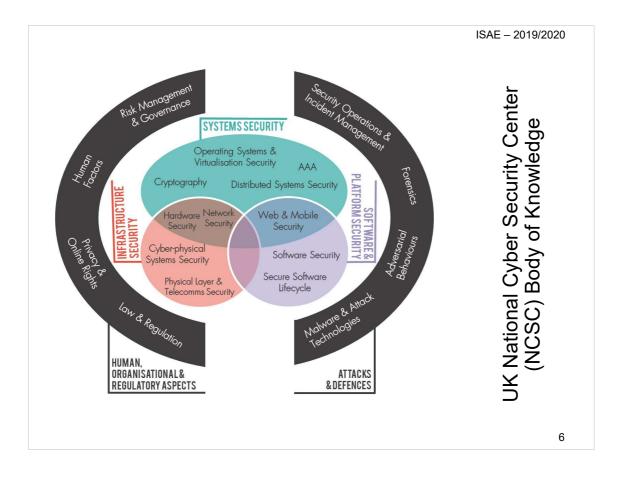

- Non-technical activities
 - Agents habilitation
 - Written delegation
 - Contracts
 - Security awareness
 - Teaching
- Protection
 - Network
 - System
 - Applications

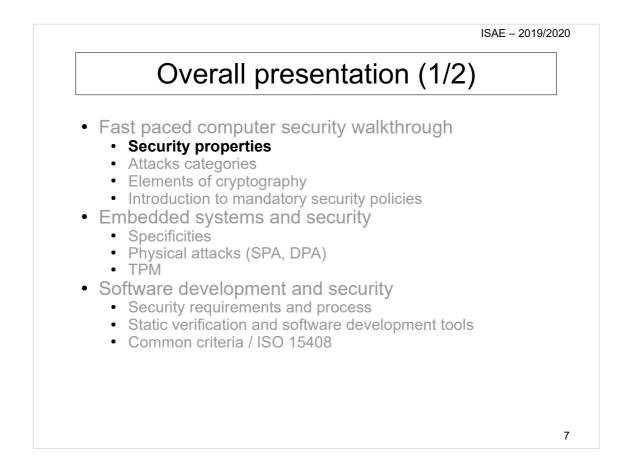

Monitoring

- Intrusion detection
- · General monitoring

- Threats awareness
 - Attacks
 - Vulnerabilities / Audit
 - Intrusion testing
- Risk management and risk evaluation

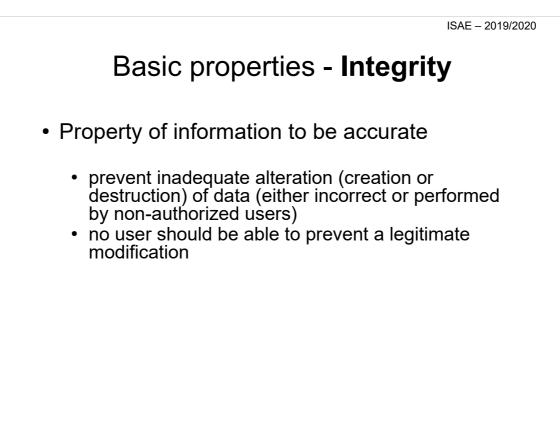

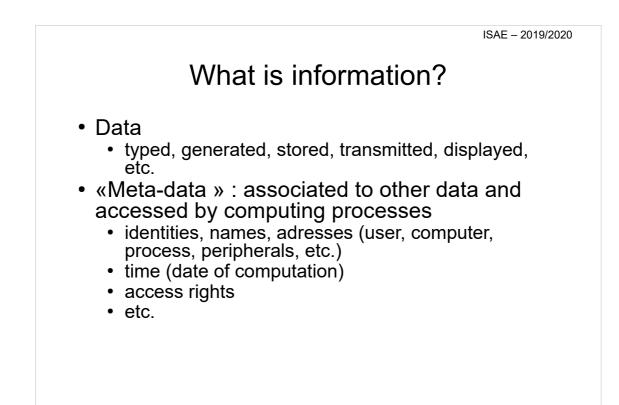

Basic properties - Confidentiality

- Property of information not to be revealed to non-authorized users
 - prevent users from reading confidential data, unless they are authorized
 - prevent authorized users from communicating confidential data to non-authorized users

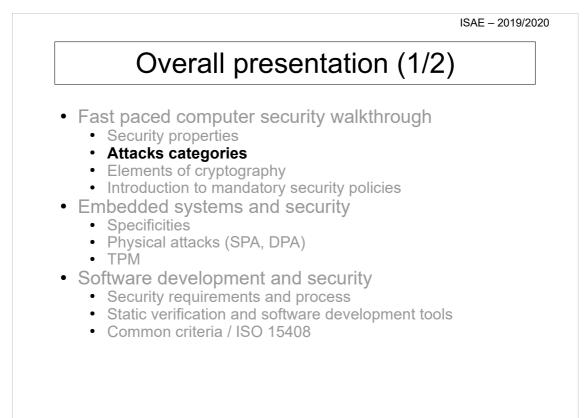

Basic properties - Availability

- Property of information to be accessible when it is needed
 - allow access to authorized users for reading or writing
 - no user should be able to prevent authorized users from accessing information

Other properties

Anonymity = confidentiality of user identity
Privacy = confidentiality of (personal data + user identity)
Message authenticity = integrity of (content + sender identity + date + ...)
Document authenticity= intégrité of (content + creator identity + date + ...)
User authenticity = integrity of identity
« Auditability » = availability of (who, what, when, where, ...) of an action
Sender non-repudiation = availability of (sender identity + ...) + integrity of content
Receiver non-repudiation = availability of (receiver identity + ...) + integrity of content
Intellectual property protection = confidentiality of content (+ integrity of container)

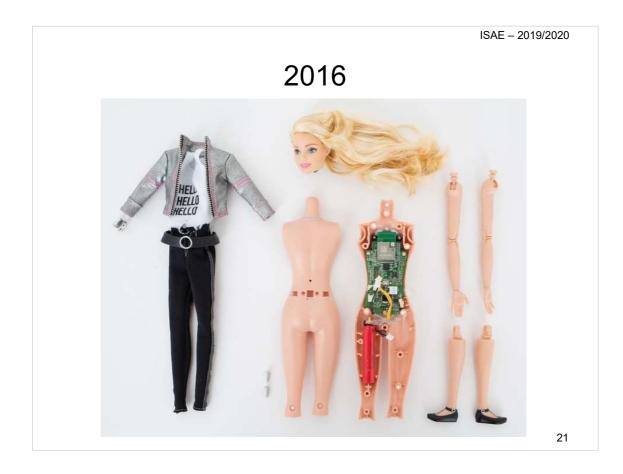

Attackers and their motivations

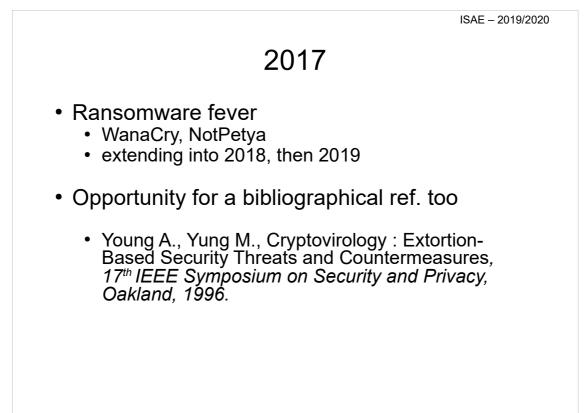

- Game : exploration (to the limits), extend and apply knowledge, find new weaknesses, improve security : "hackers" ("pirates" = "crackers")
- Emulation, sectarism : group of hackers : "exploits"
- Vandalism : strengh demonstration, punish : "web defacing", virus, worms...
- Political, ideological : ex. CCC
- Vengeance
- Profit : espionnage, funds extorsion : unfair concurrency, organized crime
- Cyber war, terrorism?
- Awareness raising, lobbying
- Abusive protection : ex. SONY

- Microsoft OSes expose a significant vulnerability from Windows 95 onward
 - CVE-2014-6332
 - 19 years, some BSD code has already revealed things (probably) older in the past years
 - Where is the continuous improvement promised by commercial companies?
 - And why are there still older versions in production with no fixes (and possibly more bugs)?
- OpenSSL/LibreSSL fork and some CVE record broken...

23

~2017

- Actually very early 2018, but...
 - ... press coverage timeline is not always important

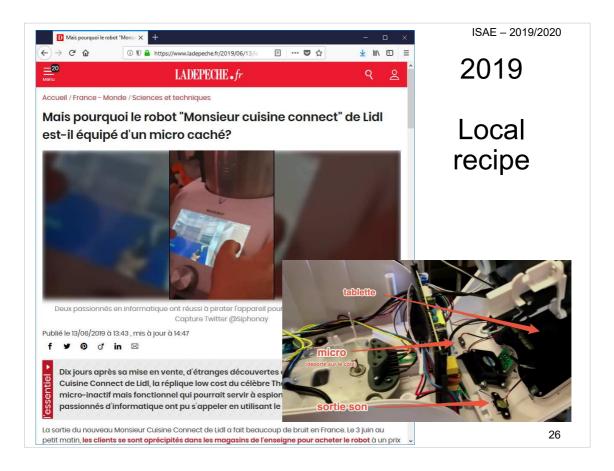

Vulnerabilities involving CPU hardware design

- Speculative execution, data/inst. Caches
- Nicknames : Spectre, Meltdown
- Academic names
 - Covert channels (circa. 1987)
 - Auxiliary channels (circa 1996)

Computer apocalypse

• Once again

ISAE - 2019/2020 WebAuthn vs. « March-2018! » × W3 Web Authentication: An A... × + C Q Rechercher ☆ 自 🖡 🎓 🛡 ← ① https://www.w3.org/TR/webauthn/ = Web Authentication: An API for W3C[°] accessing Public Key Credentials Level 1 W3C Candidate Recommendation, 20 March 2018 This version: https://www.w3.org/TR/2018/CR-webauthn-20180320/ Latest published version: https://www.w3.org/TR/webauthn/ Editor's Draft: https://w3c.github.io/webauthn/ Previous Versions: https://www.w3.org/TR/2018/WD-webauthn-20180315/ https://www.w3.org/TR/2018/WD-webauthn-20180306/ https://www.w3.org/TR/2017/WD-webauthn-20171205/ https://www.w3.org/TR/2017/WD-webauthn-20170811/ https://www.w3.org/TR/2017/WD-webauthn-20170505/ https://www.w3.org/TR/2017/WD-webauthn-20170216/ https://www.w3.org/TR/2016/WD-webauthn-20161207/ https://www.w3.org/TR/2016/WD-webauthn-20160928/ https://www.w3.org/TR/2016/WD-webauthn-20160902/ https://www.w3.org/TR/2016/WD-webauthn-20160531/ Issue Tracking: GitHub Editors: 24

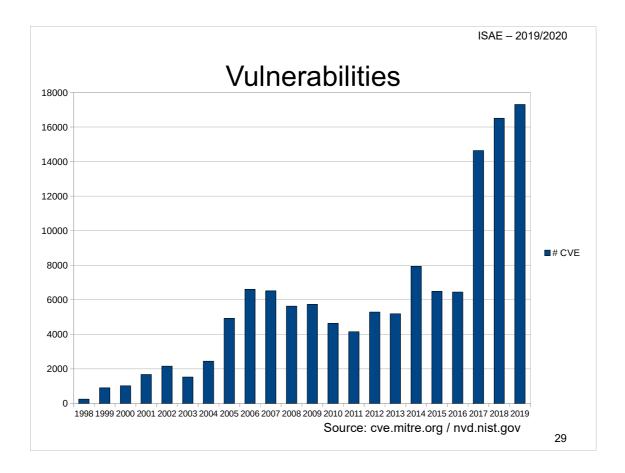

2019

- Merck
 - 2017, NotPetya \$870m damage
 - Insurance claim
 - \$150m deductible, \$1.65bn cap
- Allianz, AIG
 - Denied coverage
 - « hostile or warlike » act or an act of terrorism (excluded)
- \$1.3bn claim in court in New Jersey atm for breach of contract, *featuring*:
 - a big pharmaceutical lab

- a few big insurance companies a few US/UK intelligence assessments
 - evil foreign hackers, presidents tweets, load of bitcoins, ...

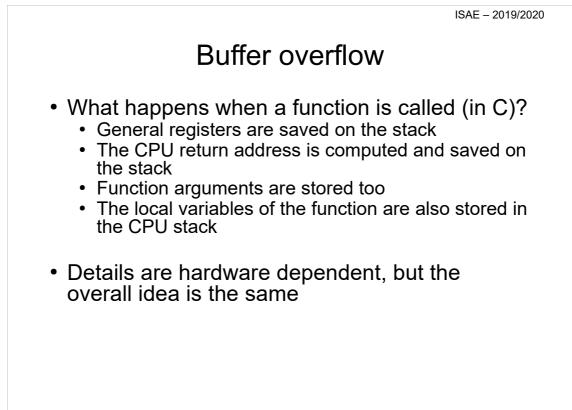

Buffer overflows

- Buffer overflows are a notorious problem
- Many exploits are based on them
- They are very easily introduced by simple programming mistakes
- BTW, very nice reference for *applied* secure programming
 - http://www.openbsd.org/papers/

Most C examples taken or adapted from "Puffy at Work", Henning Brauer, Sven Dehmlow

33

A function
 void function(char *str) {
 char buffer[16];
 strcpy(buffer,str);
 }

 A buffer overflow
 int main(void) {
 char *s = "Soy demasiado largo
 para este espacio.";
 function(s);
 }

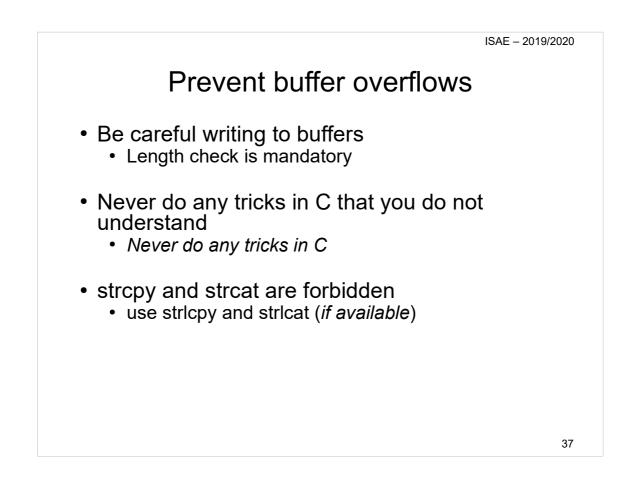

```
Impact ?
Program behavior is unpredictable
Write to unexpected stack sections
Can we overwrite the return address?
With carefully chosen values, it is possible to enforce where the CPU execution returns at the end of the function
This could be in code under our control, if we manage to inject it somewhere in memory (e.g. on the stack itself)
```

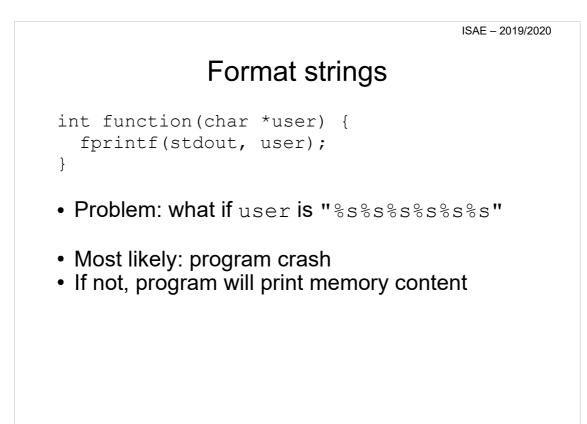

Not always that obvious

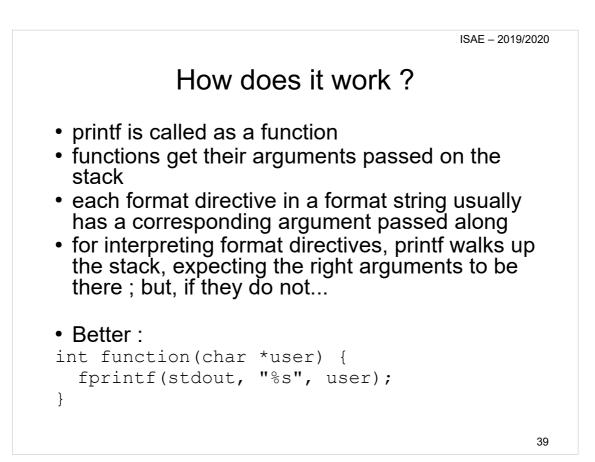

```
void function(int a, int b, int c) {
    char buffer1[8];
    char buffer2[16];
    int *ret;
    ret = buffer1 + GAP_TO_PC_ON_STACK;
    (*ret) += WIDTH_OF_1_CINSTRUCTION;
}
void main() {
    int x;
    x = 0;
    function(1,2,3);
    x = 1;
    printf("%d\n",x);
}
```

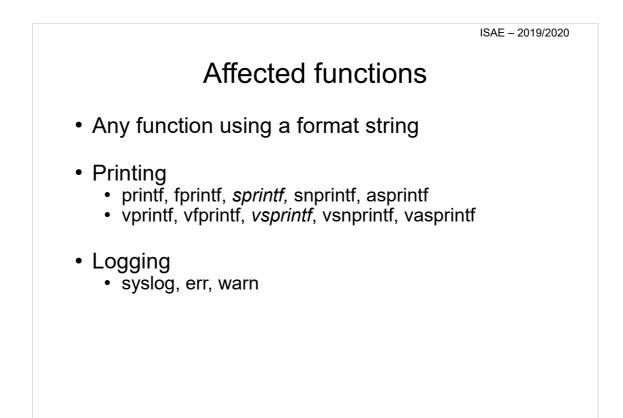

SQL Injection

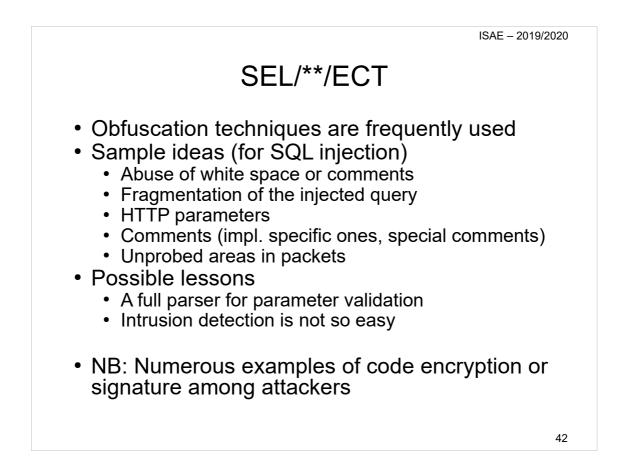

• Building the query naively statement = "SELECT * FROM users WHERE name = '"+ userName+"' AND pwd = '"+userPassword+"';"

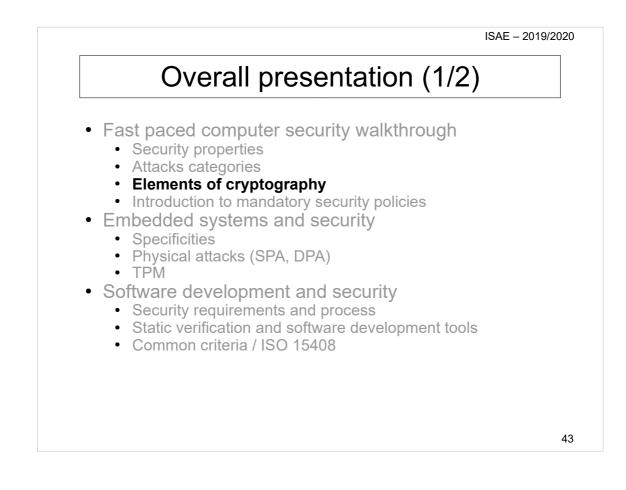

What if

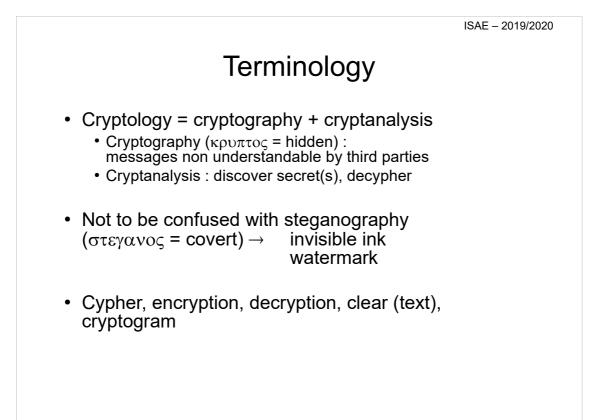

- userName is « ' OR '1'='1'; -- ' »
 userPassword is not a problem anymore
- userName is « ' or '1'='1'; drop tables; -- ' »
 - The application is not a problem anymore either

• Mitigation

- Prepared statements (+ parse + execute)
- SELECT * FROM users WHERE name = ? and pwd = ?;
- External libraries (for auth. or SGDB mapping)
- Parsing or escaping (not recommended)

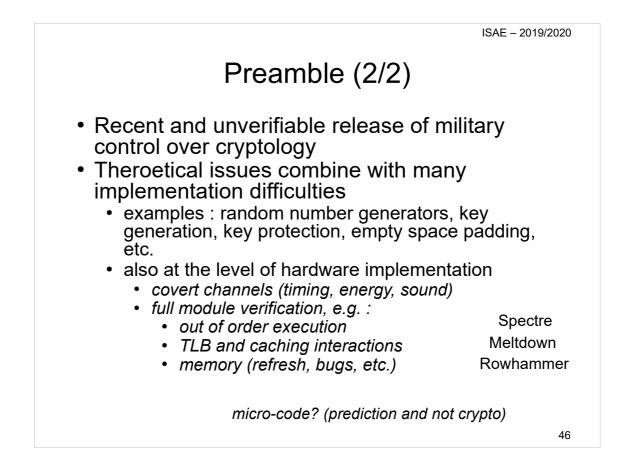

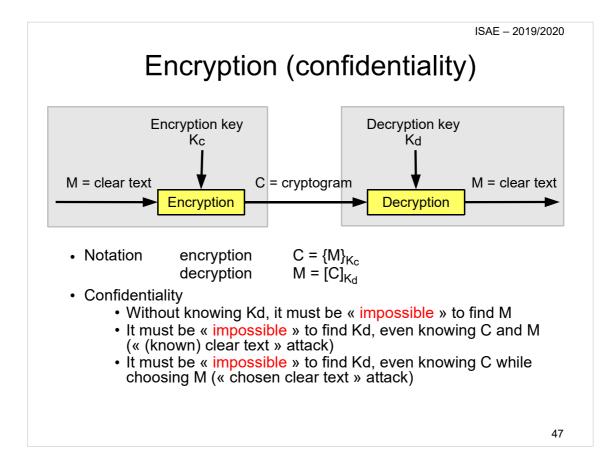

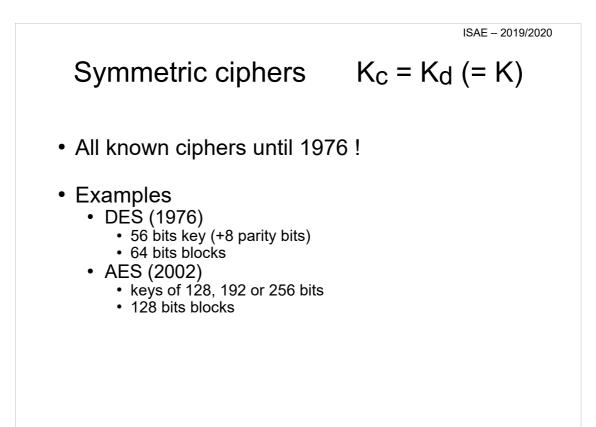

Preamble (1/2)

- A domain of mathematics which exhibits some of the most significant advances of the end of 20th century, but
 - Mathematical proofs (of strength) are rare
 - Ciphers do break
 - Implementations do break too
 - Few experts (possibly few knowledgeable people)
- Difficult and counter-intuitive
 - example: encrypting twice can be dangerous

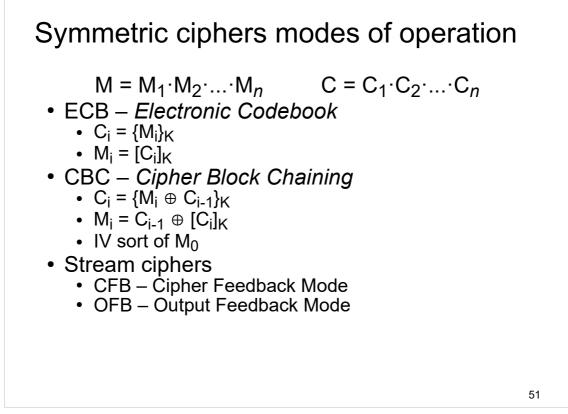

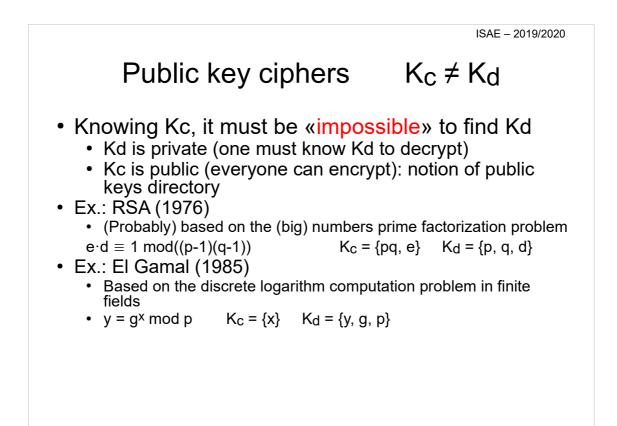

DES : Data Encryption Standard (1975)

- Story
 - Base from IBM. With improvements from NSA.
 - The first algorithm scrutinized by NSA to become public... thanks to the standardization body.
- 64 bits blocks. Key of 56 bits + 8 bits (ex.: parity)
- Design oriented towards hardware implementation
- 3DES : common (generic) improvement
 - 112 bits key
- Huge public cryptology efforts associated to DES
- Feistel cipher family
- Lots of variants (ex.: key-dependent S-boxes)

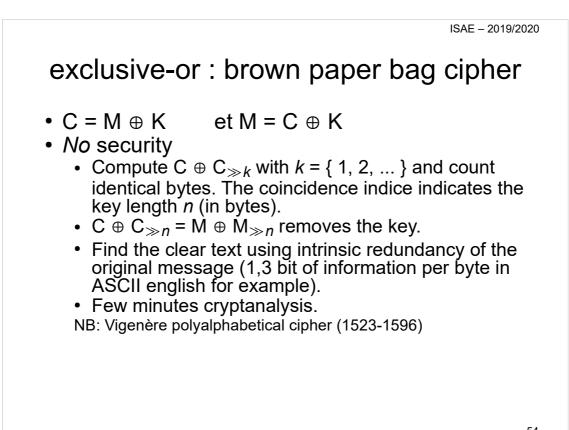

AES : Advanced Encryption Standard (2001) Story Selected by NIST from 15 proposals over a 5 year public selection process Originally called Rijndael. 128 bits blocks. Keysize of 128, 192 or 256 bits Fast in both software and hardware Still resistant to open attacks (after a decade). Substitution-permutation network family. Algebraic representation over GF(2⁸) Now very wide adoption AES-NI instruction set (Intel/AMD).

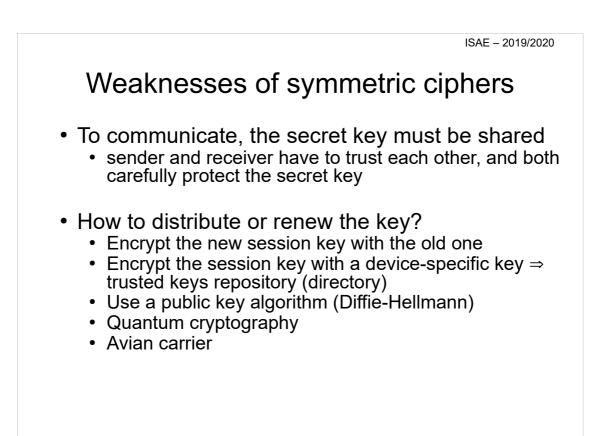

One-time pad : perfect cipher

- The key is a serie of random bits as long as the message and the algorithm is exclusive-or
 - C_i = {M_i}_{K_i} = M_i ⊕ K_i
 - $M_i = [C_i]_{K_i} = C_i \oplus K_i$
- According to information theory (Shannon), this is a perfect cipher (the key must **never** be reused)
 - Not very convenient
 - Possible

Strengths of symmetric ciphers

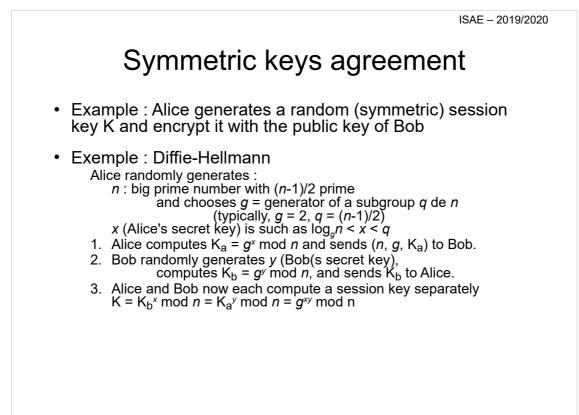

- Speed
 - ~1 Gb/s in hardware
 - \sim 100 Mb/s in software
- « Short » keys
 - 80 bits typically to withstand brute force attacks (today)
- Convenient to encrypt personal files (no need to share a key)

Strengths of public key ciphers

- No trust needed between sender and receiver
- « Easy » key management
 - · Public directory of public keys or peer to peer exchange
 - The private key must « never » be sent
- Allow for new kind of usage : symmetric keys distribution, electronic signature, certificates, etc.

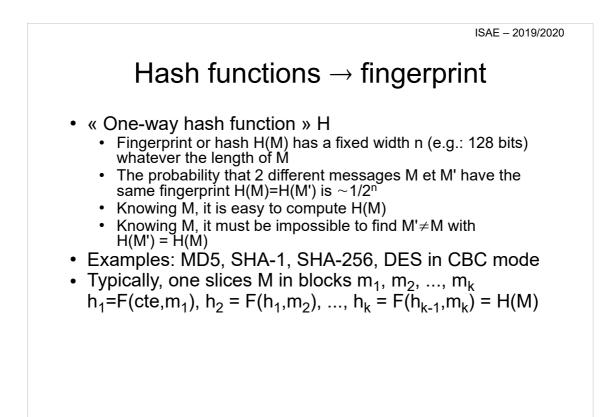

Weaknesses of public key ciphers

- Complex computation
 - slow (~1 Mb/s)
 - long keys (1024 or 2048 bits), except with elliptic curves (~160 bits)

Specific problems

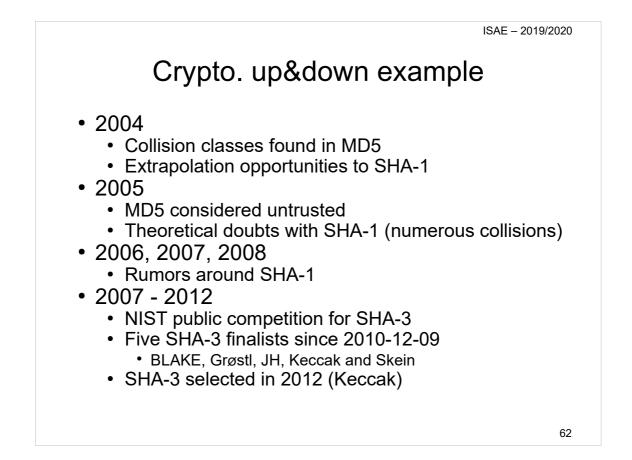

- Integrity of public keys directory
- Keys lifetime
- Revocation
- Private key sharing necessity?
- · Algorithms limitations : e.g. encrypt a small M with RSA

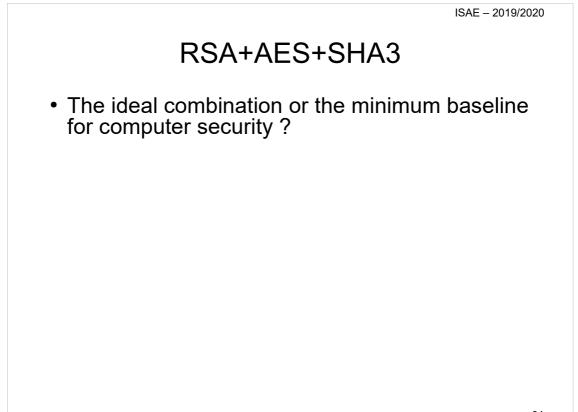

Application : integrity

- Networking : against man-in-the-middle send message and fingerprint through distinct channels
- Files : modification detection
 - Examples : Tripwire, Samhain
 - On a trusted host, compute the fingerprints of stable files (OS, configuration, main programs, ...) and keep them in protected storage
 - Regularly or in case of doubt, recompute fingerprints to check them (with a trusted computer)

	Julius. Caesar Via Appia 1 Rome, The Roman Empire	v	ılius. Caesar ia Appia 1 ome, The Roman Empire
May, 22, 2005		May, 22, 2005	
To Whom it May Concern:		Order:	
Alice Falbala fulfilled all the requirements of the Roman Empire intern position. She was excellent at translating roman into her gaul native language, learned very rapidly, and worked with considerable independence and confidence.		Alice Falbala is given full access to all confidential and secret information about GAUL.	
Her basic work habits such as punctuality, interpersonal deportment, communication skills, and completing assigned and self-determined goals were all excellent.		Sincerely,	
I recommend Alice for challenging positions in which creativity, reliability, and language skills are required.		Julius Caesar	
I highly recommend hiring her. If you'd like to discuss her attributes in more detail, please don't hesitate to contact me.		ttp://www.cits.rub.de/	MD5Collisions/
Sincerely,			
Julius Caesar	<pre>ortalo@hurricane:~/\$ md5sum letter_of_rec.ps order.ps a25f7f0b29ee0b3968c860738533a4b9 letter_of_rec.ps a25f7f0b29ee0b3968c860738533a4b9 order.ps ortalo@hurricane:~/\$ 63</pre>		

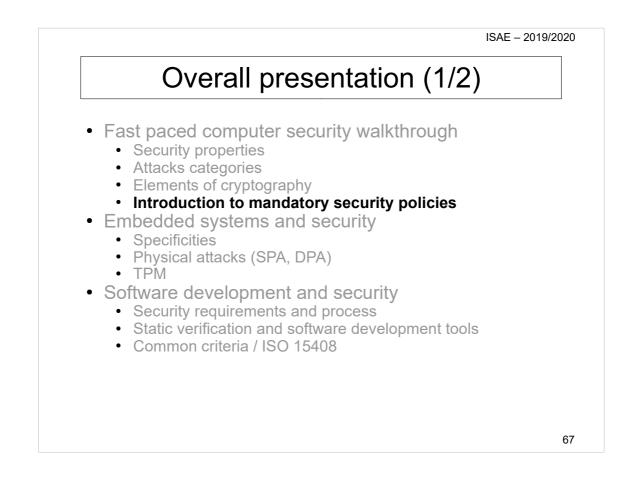

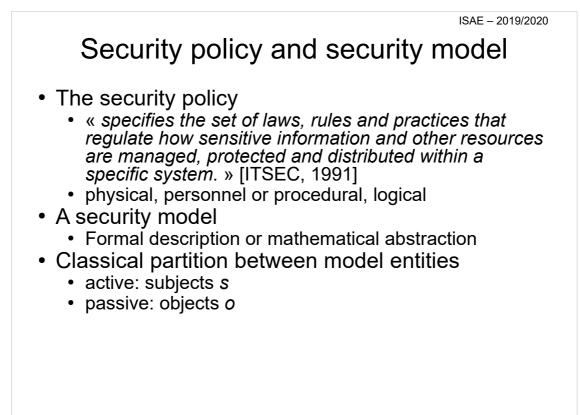

Use crypto. correctly

Use proven code instead of rewriting, do not reinvent the wheel (or the brakes)

- Nintendo Wii
 - Used strncmp() instead of memcmp() to compare the SHA hash
- Works well when one feeds it a signature that starts with null bytes
- Strings in C are null terminated
- A null byte is only 256/2 random attempts away on average

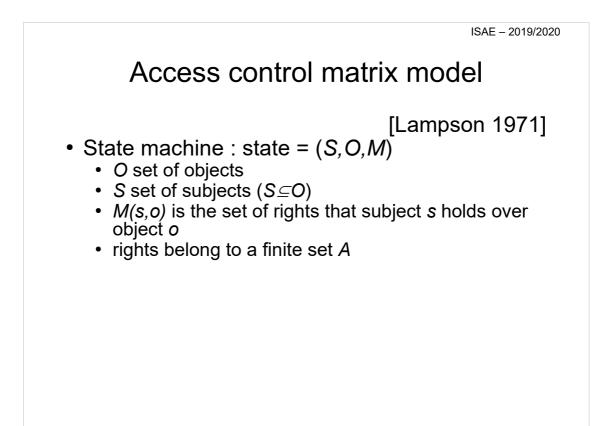

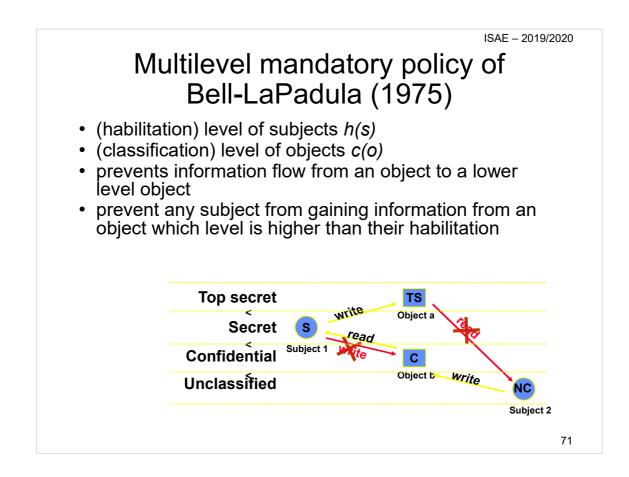

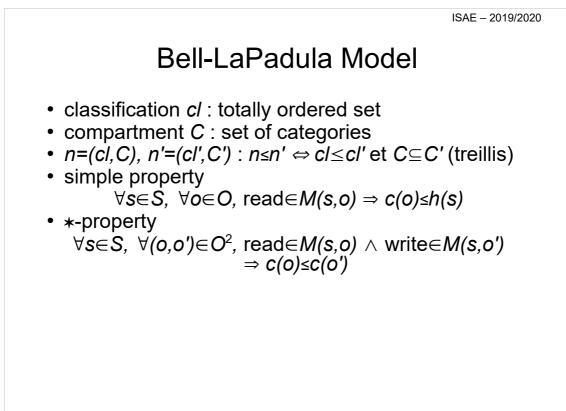

Discretionary and mandatory policies

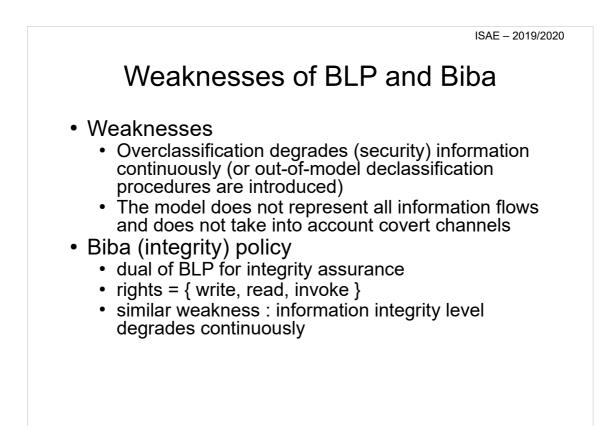

- Descretionary policy
 - each object o is associated to a specific subject s, its owner who manipulates access rights at his descretion
 - the owner can freely define and grant such access rights to himself or another user
- Mandatory policy
 - discretionary rules (access rights)
 - and : mandatory rules (habilitation level)

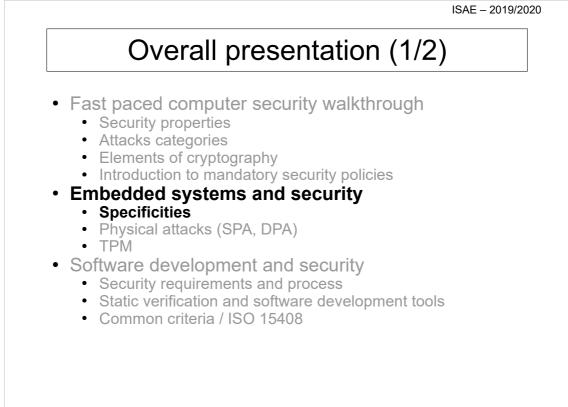

Policy, protection and access control

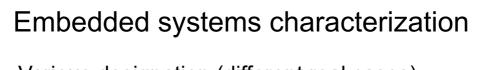

- Security rules are enforced via security mechanisms (hardware or software)
- Easy to imagine for rules like « it is permitted to... » or « it is forbidden that... » – protection mechanisms – privileged instructions, memory access control, file access control, etc.

→ authorization

 Harder for rules like « it is mandatory that... » or « it is recommended that... »

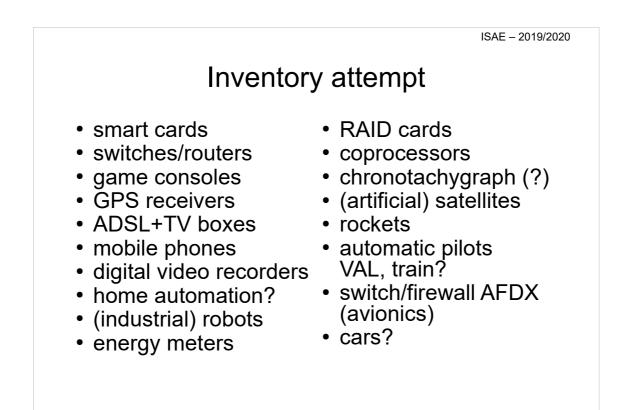

→ action triggers, ressource management

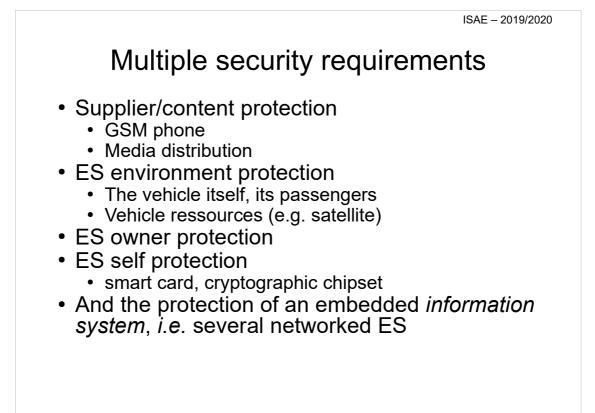

- Various designation (different real cases)
 - real-time
 - critical
 - embedded (in a vehicle)
 - autonomous / distant from the power plug
 - hidden / distant from any user
 - distributed (communicating?)
 - integrated (in a hardware platform)
 - other? : lost, stolen, fallen from the shelf (repurposed...), numerous&similar?
- Up to now, not so different from a regular computer (esp. from the security point of view)

Domains of application

- Industry
 - · Industry automation and robotics
 - Energy (smart grid)
- Vehicles
 - Avionic domain
 - Space domain
 - Ground-transport domain
- Consumer electronics
 - mobile telephony
 - video games
 - Internet acces (high speed)
 - media broadcasting

Evolution

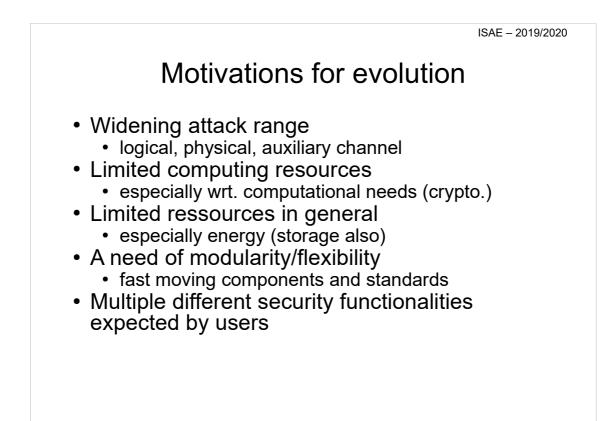

from

• Some security functionalities

to

 Security management at the system design and architectural level (both hardware and software)

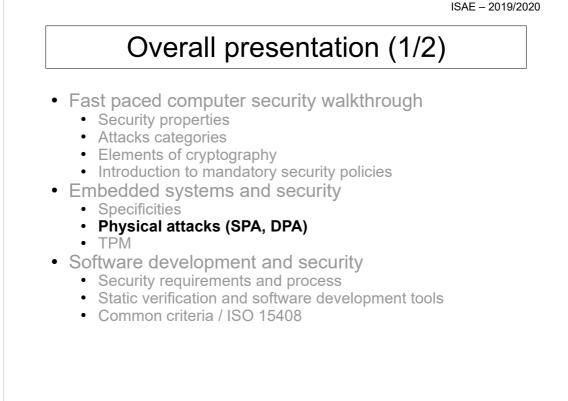

Security of industrial systems is getting a lot of attention recently (and then?)

Challenges

- complexity
 - embedded software gets more and more complex
 - efficient languages (Č, C++) are not specifically secure
- extensibility
 - Java, .NÉT: designed for extension
 - J2ME, JavaCard too
 - dynamic updates (with code execution)
 - mise à jour (exécution) dynamique
- networking
 - WiFi, bluetooth
 - Internet

Note : Nothing really specific to embedded systems...

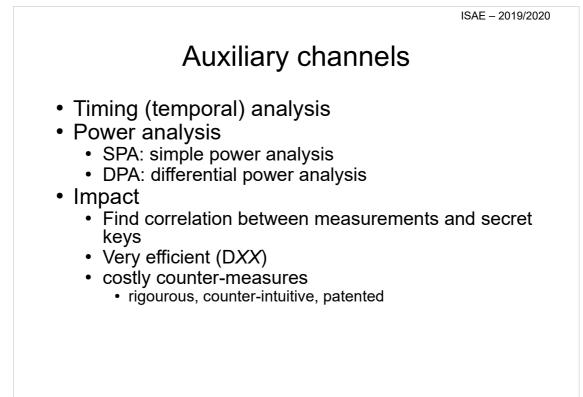

Physical attacks

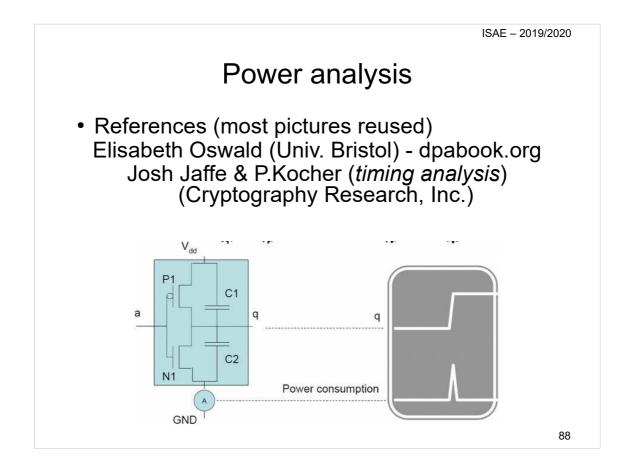

• Direct hardware attack

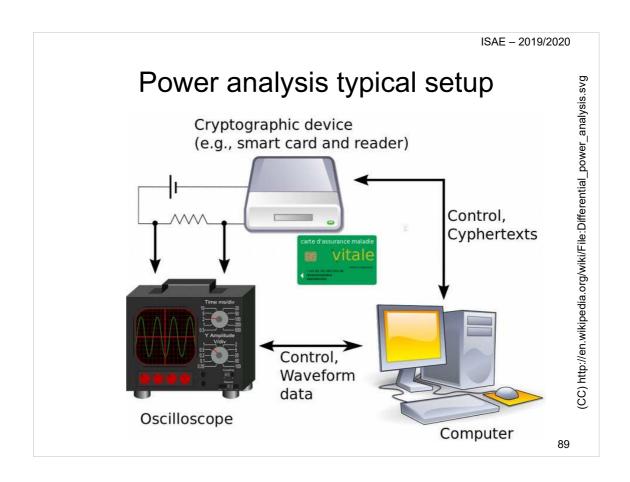

- micro-probing
- substrate reconstruction
- debugging interface access (JTAG, etc.)

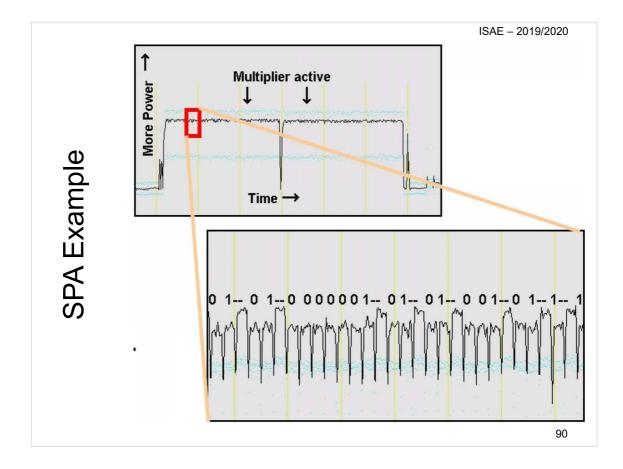

• Difficulties

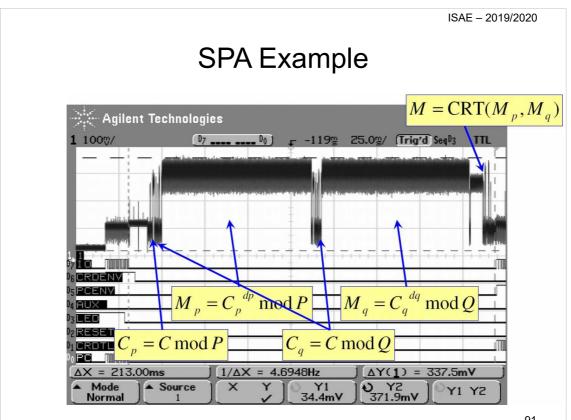

- Costly (with respect to other attacks)
- Destructive
- Alternative attack precursor
- Primary target: cryptographic chipsets

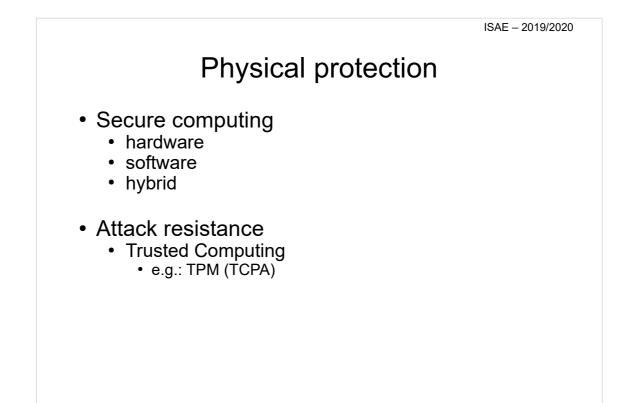

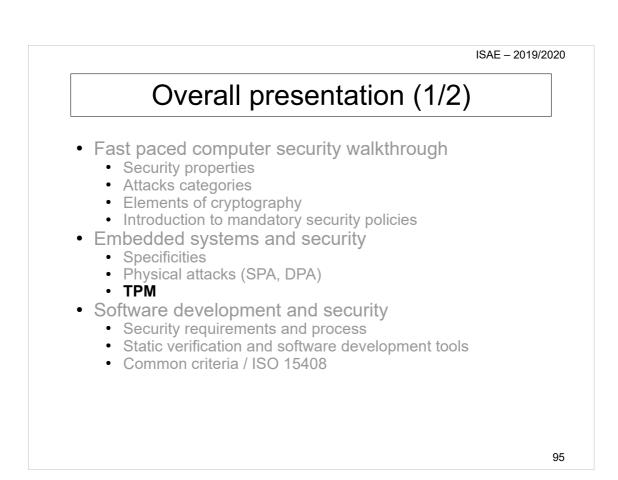

92

Alternative attacks

- DPA
 - Differential power analysis
 - Much less sensitive to noise disruptions
- Fault injection
 - induce normal behavior perturbation
 - may allow deduction of secret information
- EMA
 - electromagnetic analysis
 - best of *eighties* (TEMPEST protection)
 - remastered

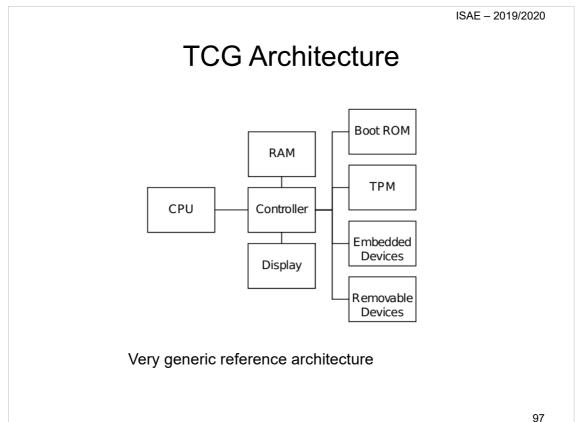

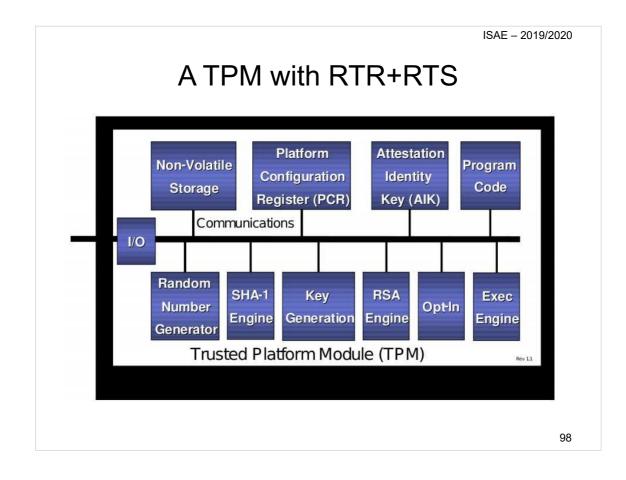

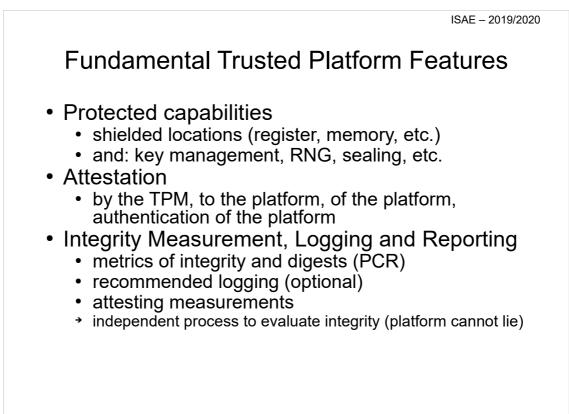

TPM

- Trusted Platform Module
- from the Trusted Computing Group (TCG)
 - http://www.trustedcomputinggroup.com/
 - « ... open, vendor neutral, industry standards for hardware-enabled trusted computing and security ... »
 - Promoters (2008)
 - AMD, Fujitsu, HP, IBM, Infineon, Intel, Lenovo, Microsoft, Seagate, Sun, Wave
 - Contributors, Adopters... (140 members)
 - successor of TCPA (and competing Palladium?)
 - established in 2003

96

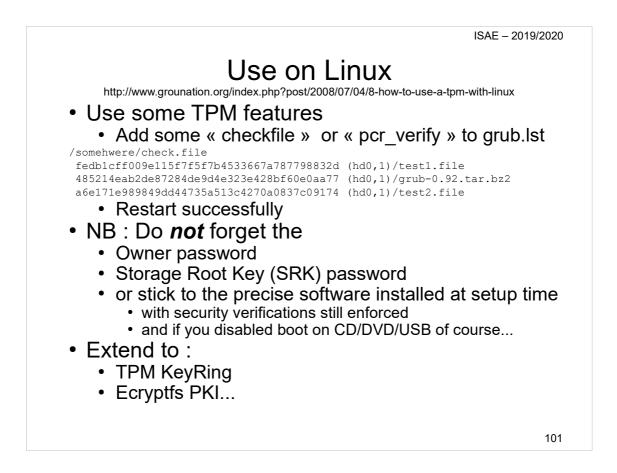

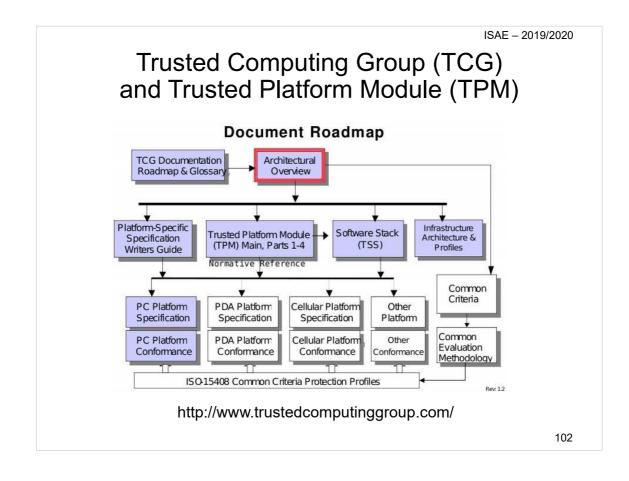

Use on Linux

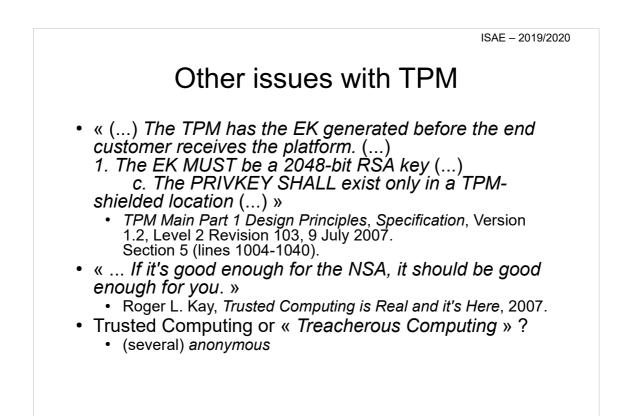

http://www.grounation.org/index.php?post/2008/07/04/8-how-to-use-a-tpm-with-linux

- Enable TPM in BIOS / Load drivers
- Install tpm-tools and TrouSers
- Take Ownership (once and for all)
- (Compile) Install and setup TrustedGRUB
 - Restart successfully
 - Contemplate PCRs
 - PCR 0 to 3 for the BIOS, ROMS...
 - PCR 4 contains MBR information and stage1
 - PCR 8,9 contains bootloader information stage2 part1,2
 - PCR 12 contains all commandline arguments from menu.lst and those entered in the shell
 - PCR 13 contains all files checked via the checkfile-routine
 - PCR 14 contains all files which are actually loaded (e.g., Linux kernel, initrd, modules...)
 - PCR 15 to 23 are not used

```
100
```

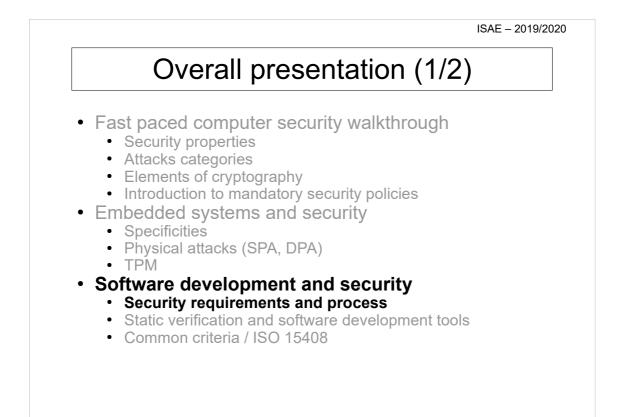

Contrast with UEFI

- Microsoft Secure boot
- The initial master key is controlled by Seattle
- And it delegates...
- Side note
 - Fortunately, there is JTAG...

Introductory programmer comment

World-writable memory on Samsung Android phones

Posted Dec 17, 2012 20:13 UTC (Mon) by mikov (subscriber, #33179) [Link]

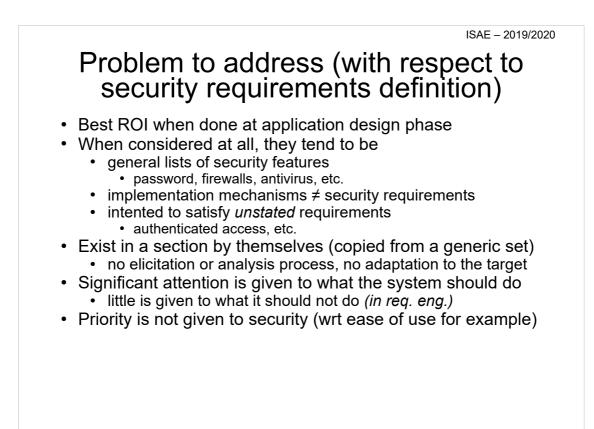

My experience from most places: nobody cares, nobody reviews. If a problem is discovered later, we will fix it later - why worry now and delay the release? What "/dev/mem"?? Enough with this mumbo-jumbo we have a release to make and management bonuses to earn.

In fact people who do care and worry about esoteric things like "security", or "good design" or "code quality" are universally viewed as trouble-makers or ivory tower idiots both by management and most of the engineers. It is an uphill battle even to do what used to be the baseline 10-15 years ago.

Commercial software engineering now is no different from accounting. The glory days are gone. It is all downhill from now on.

http://lwn.net/Articles/529496/

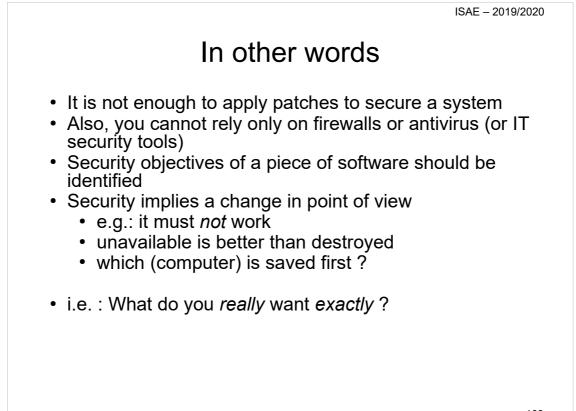

BTW, Cyanogen fix: http://review.cyanogenmod.org/#/c/28568/

Note on security updates

- How can we manage software vulnerabilities?
 - · Wait until they are exploited by an attacker
 - Quickly provide a patch that should correct the problem (without introducing another one)
 - Whine because system administrators do not install patches fast enough
- · Astonishingly it is very popular
 - All serious editors do that
 - Users feel more secure (still?)

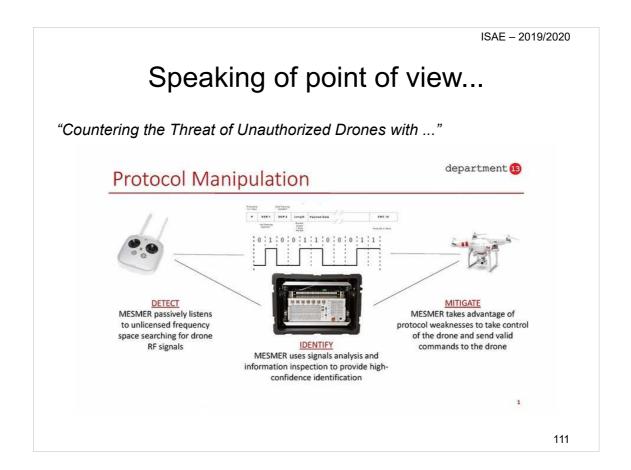

Improving security Using Extensible Lightweight Static Analysis, David Evans and David Larochelle, *IEEE Software*, January/February 2002.

Drones firmware security update

- DJI firmware update
 - february 2015
 - Phantom 2
 - Phantom 2 Vision (+)
- integrates
 - a no-fly zone
 - 15.5 miles radius
 - around the...White House
- guess why ?
- et l'Elysée au fait ?

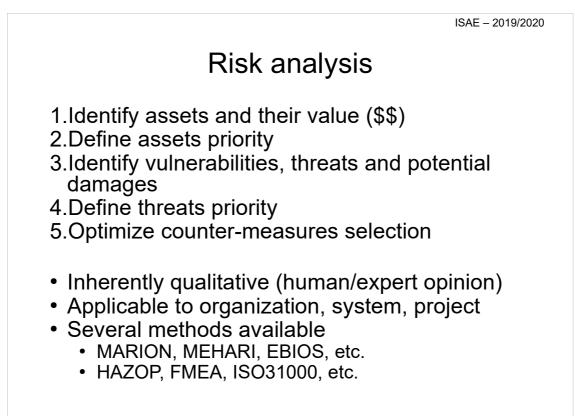

- Detailed needs ?
 Security policy consideration
- Specs ?
 Security specification
- Contracts
- Development
- Integration
- Validation
 Security validation/configuration
- Exploitation Monitoring / Management
- Maintenance
 Disposal ?

Quid ?

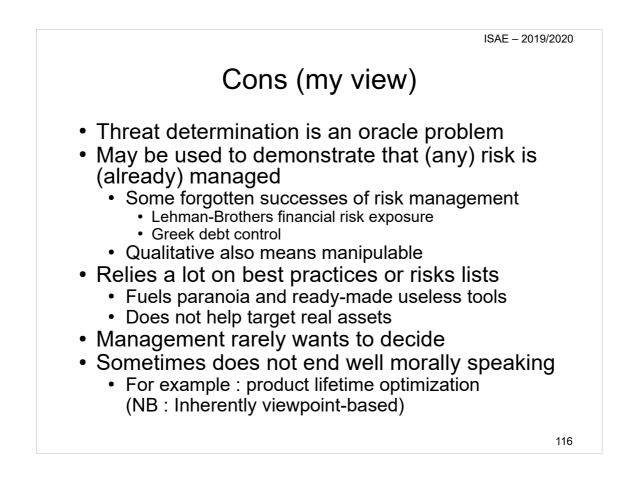

Pros (my view)

- Identification of assets and their relative values
- Assets value offers an opportunity to budget realistically (for protection)
- Is understandable by end users
 - Quite easier than assembly language exploits or cryptographic hash functions
- Risk management alternatives
 - Transfer (insurance, state, etc.)
 - Acceptance (life is deadly after all)
 - Reduction (work, work, work, work, ...)
 - Avoidance (just do it the other way)
- Management could express clear priorities

115

Threats and use-case examples

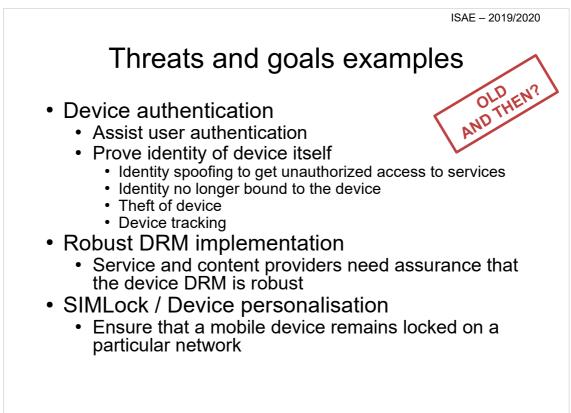

• Trusted Computing Group

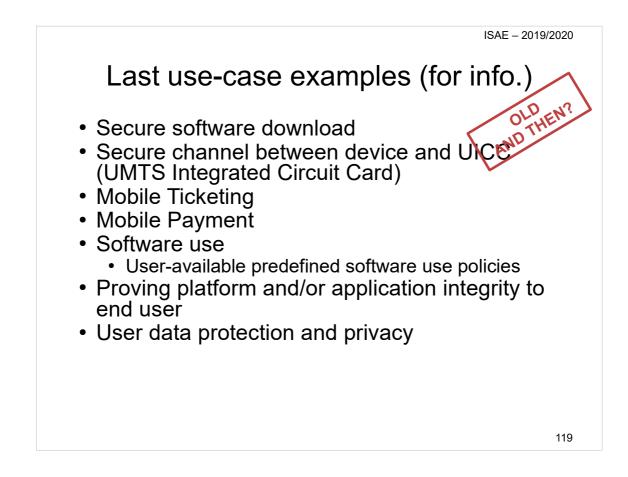

- Mobile phone TPM use-case scenarios
- (Name,) Goal
 - Threats

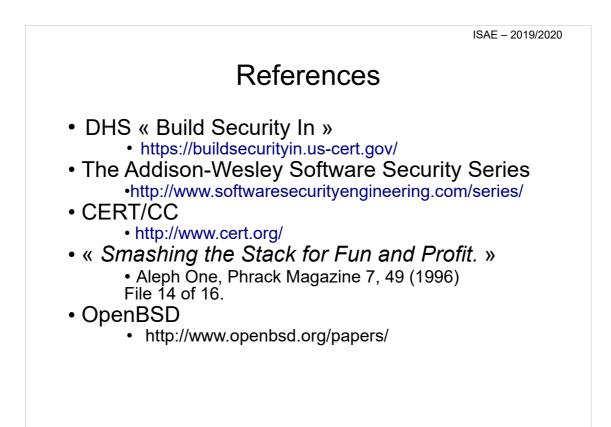

• Platform integrity

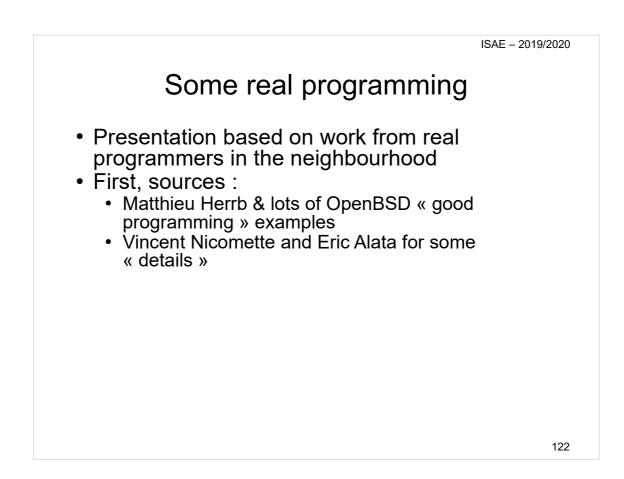

- Ensure that device possess and run only authorized operating system(s) and hardware
 - · Logic of device firmware modified
 - Device hardware modified
 - Device functions in a manner other than intended by the manufacturer
 - Device modified to broadcast false identification (IMEI)

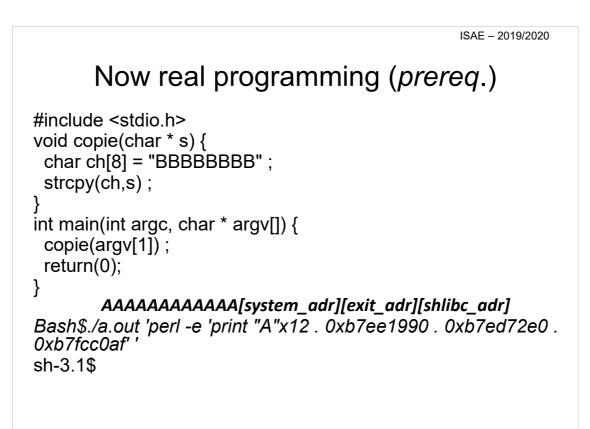

117

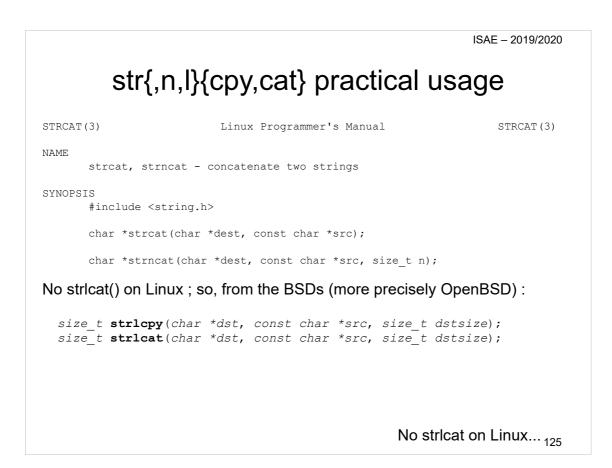

Now real programming

• Number One : buffer overflow with string functions

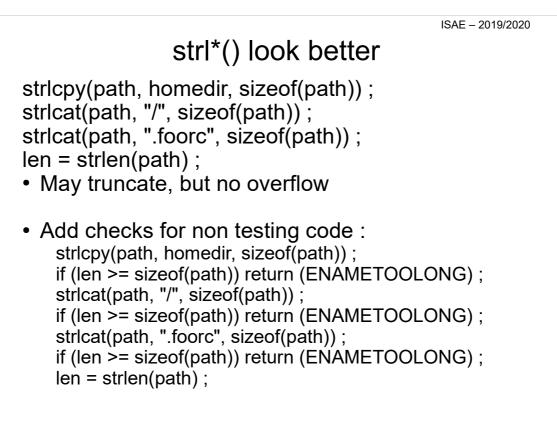

strcpy(path, getenv("\$HOME"));
strcat(path, "/");
strcat(path, ".foorc");
len = strlen(path);

- strcat(), strcpy()
 - no verification on buffer size, dangerous : do not use
- strncat(), strncpy()
 - leave strings non terminated, very difficult to use correctly
- strlcat(), strlcpy()
 - May truncate strings, but probably easier to use

http://homepages.laas.fr/matthieu/cours/mh-prog-defensive.pdf

strncat() is difficult to use

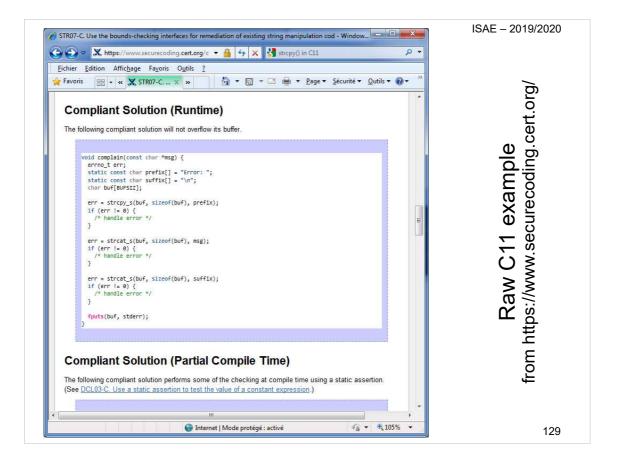

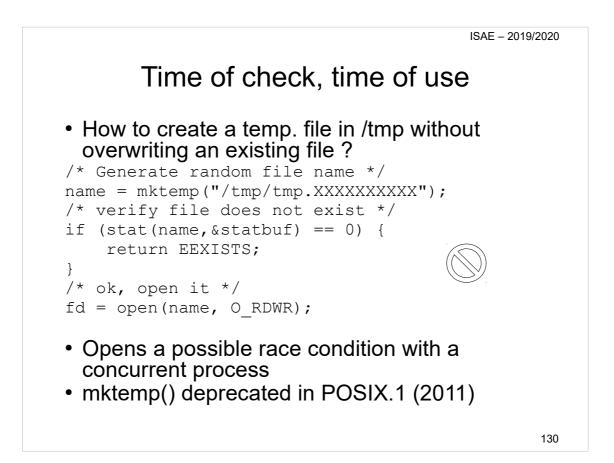

C11 Annex K (ISO/IEC 9899:2011)

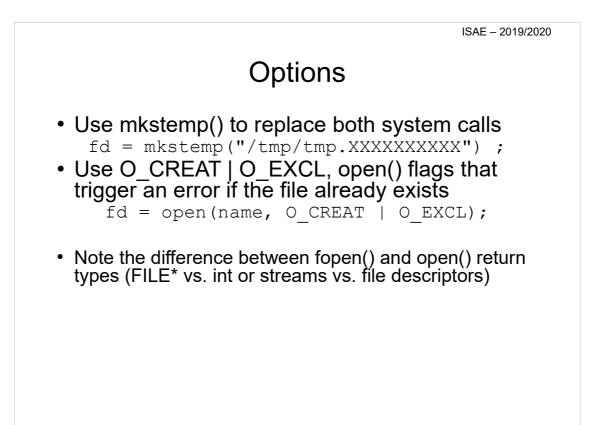

- C11 Ann.K « Bounds-checking interfaces » defines alternative versions of standard string-handling functions (from Microsoft)
- strcpy_s(), strcat_s(), strncpy_s() and strncat_s()
- *ie* :

```
errno_t strcpy_s(
   char * restrict s1,
   rsize_t s1max,
   const char * restrict s2
   );
e also: ISO/IEC TR24731-1:1999 a
```

- See also : ISO/IEC TR24731-1:1999 and ISO/IEC:TR24731-2:2010 ...
- Note : wchar_t

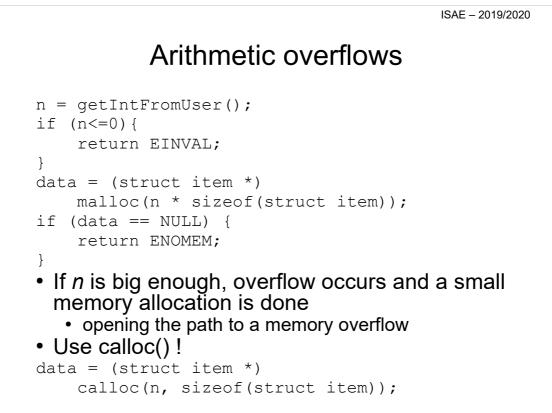

Arithmetic overflows

```
n = getIntFromUser();
if (n<=0 || n*sizeof(struct item) > BUFMAX){
    return EINVAL;
}
• If n is big enough, the condition will not be true
• Use:
n = getIntFromUser();
if (n<=0 || n > BUFMAX/sizeof(struct item)){
    return EINVAL;
}
```

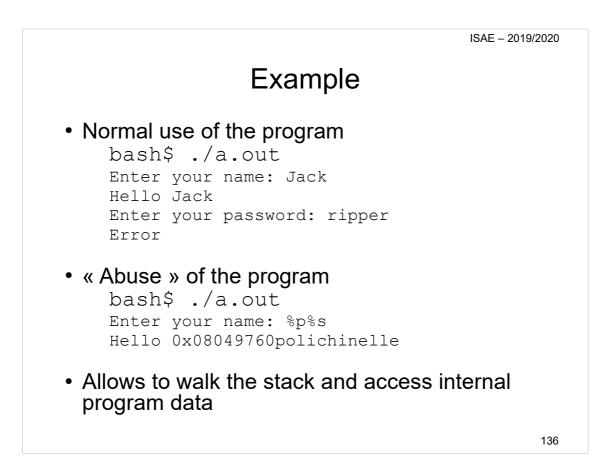

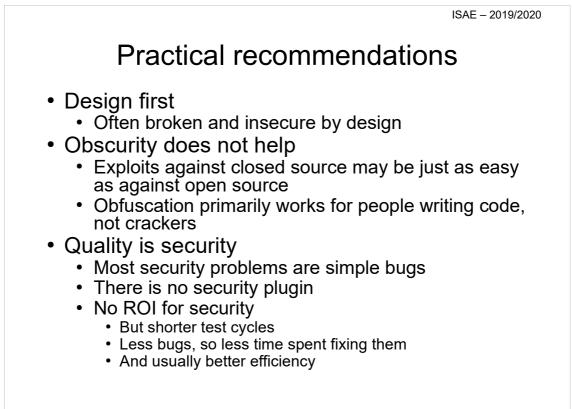

Format strings issues

- Many standard display functions use a format for printing : printf(), sprintf(), fprintf(), ...
- Two variants exist, with and without format strings : printf("%s", ch) or printf(ch)
- What happens when you give « %x » to printf ?
 - printf() gets its next argument from the stack
- When user input is passed to such functions, it can generate this kind of situations
- This kind of situation may allow to access areas of memory for reading (sometimes for writing)

134

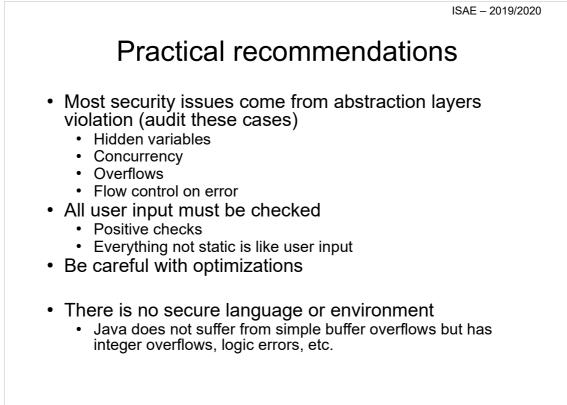

```
ISAE - 2019/2020
                     Example
#include <stdio.h>
int main()
{
    char * secret = "polichinelle";
    static char input [100] = \{0\};
    Printf("Enter your name: ");
    scanf("%s", input);
    printf("Hello ");printf(input);printf("\n");
    printf("Enter your password: ");
    scanf("%s",input);
    if (strcmp(entree, secret) == 0) {
        printf("OK\n");
    } else {
        printf("Error\n");
    }
    return 0;
}
                                                   135
```

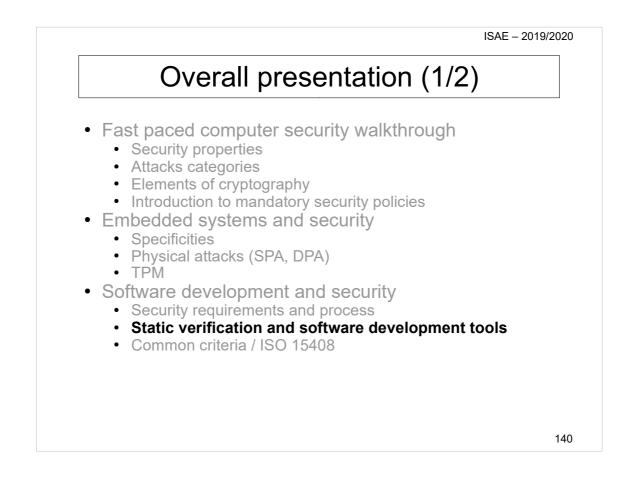

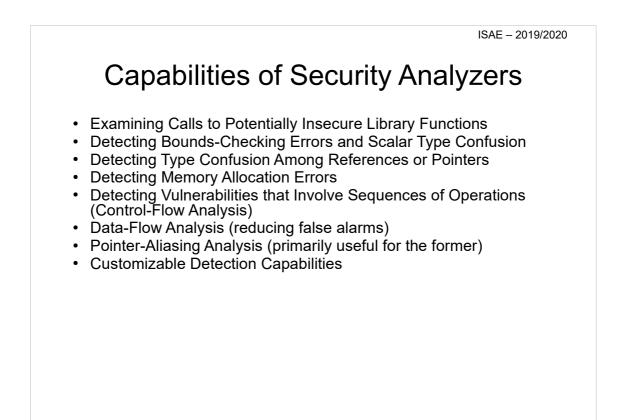

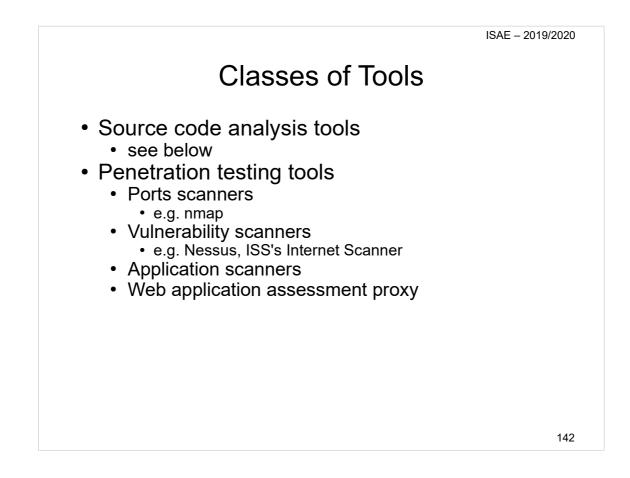

Practical recommendations

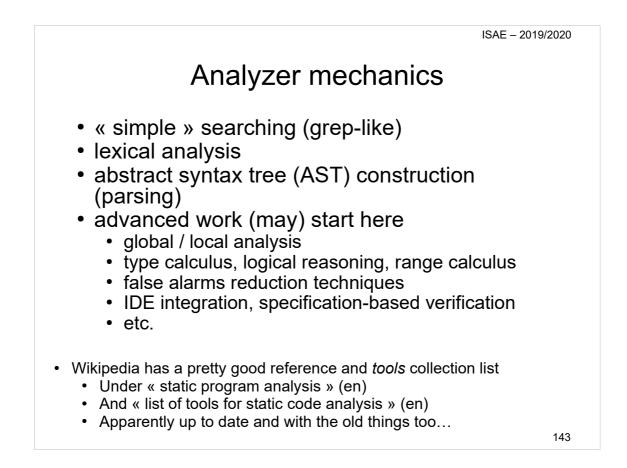

- Most code should be simple and boring
 - Easier to audit
 - Already formatted
 - Clever code is almost always wrong
- Fix a bug everywhere
 - Even automate for checking it
- Check return codes
- Design your APIs right...
- Understand semantics
 - File descriptors
 - Inheritance over fork
 - Access rights only checked on open()
 - Signal handlers *are* complex
 - Simple rule : only set volatile atomic flags in them

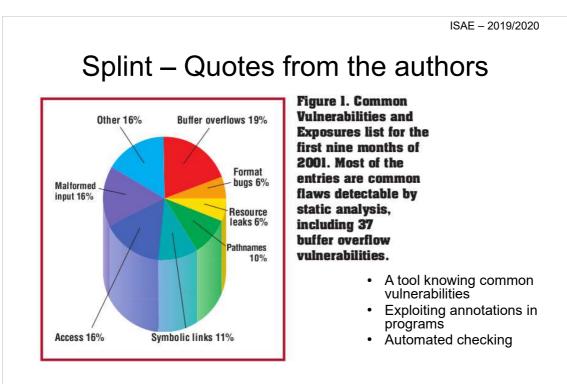

Examples (somehow outdated)

- Splint http://www.splint.org/
 - evolution of good-old lint
 - lightweight static analysis
- smatch http://smatch.sourceforge.net/
 - source checker focused on linux kernel code
 - links with sparse
 - Died, and resurrected : TBD again
- ASTREE http://www.astree.ens.fr/
 - LIENS, started Nov. 2001
 - C programs
 - real-time embedded software static analyzer
 - based on abstract interpretation

Improving security Using Extensible Lightweight Static Analysis, David Evans and David Larochelle, IEEE Software, January/February 2002.

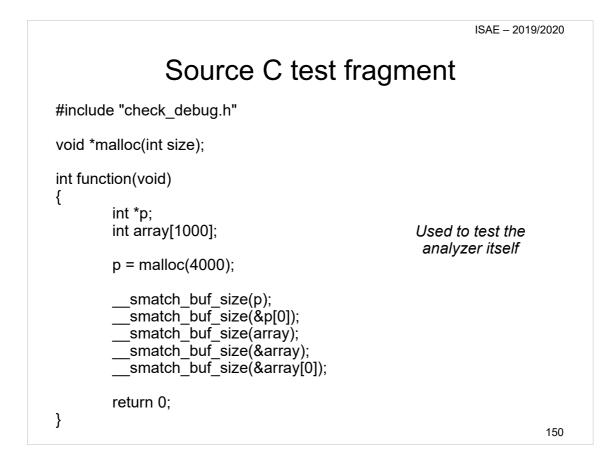

Annotation examples

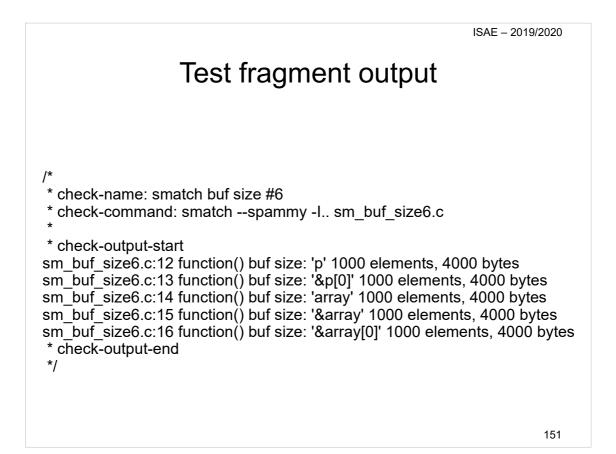

```
Library functions:
char *strcat (/*@returned@*/ char *s1, char *s2)
/*@ensures s1:taintedness =
        s1:taintedness | s2:taintedness@*/;
char *strcpy (char *s1, const char *s2)
/*@requires maxSet(s1) >= maxRead(s2)@*/
/*@ensures maxRead(s1) == maxRead(s2)
        /\ result == s1@*/;
```

	False alarm	S
		-
	Table I	
False	warnings checkin	g wu-ftpd
Cause	Number	Percent
External assumptions	6	7.9
Arithmetic limitations	13	17.1
Alias analysis	3	3.9
Flow control	20	26.3
Loop heuristics	10	13.2
Other	24	31.6

Smatch

- http://repo.or.cz/w/smatch.git
- Smatch uses Sparse as a C parser
- validation/validation_sm_buf_size6.c

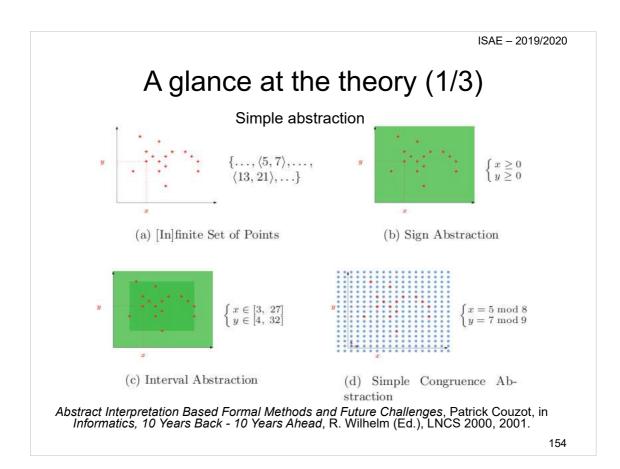

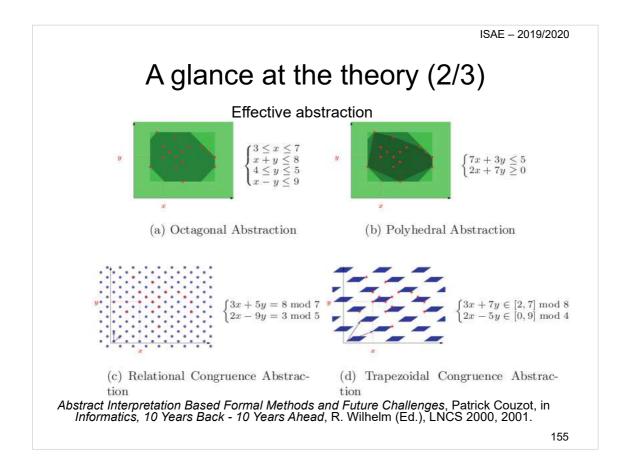

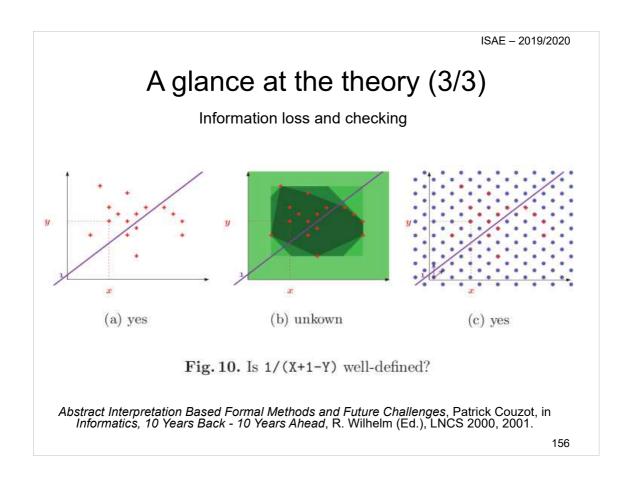

153

Abstract interpretation

- Formalize the idea of approximation
 - · to bring the correctness problem at range
- Application of abstraction to
 - the semantics of programming languages
 - static program analysis
- · competes with
 - deductive methods
 - model-checking
 - type inference

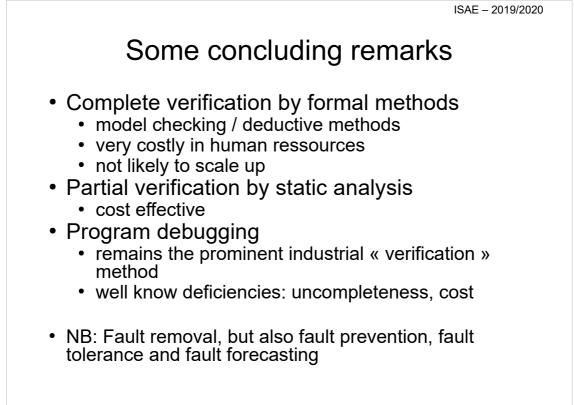

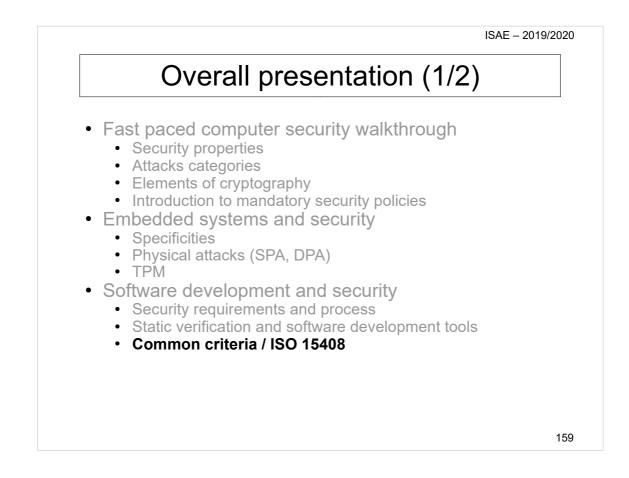

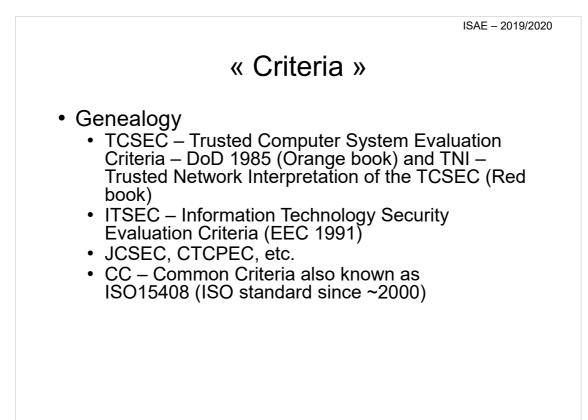

Operation report

- Specialisation to synchronous avionics code
 - produced from SCADE, no scheduling
 - intensive use of booleans and floating points
 - existence of digital filters
- Full alarm investigation needed
- 200kloc (pre-processed) C, 10 000 globals, 6h
- 467 alarms, 327 after options
- « partitioning directive »: 11 alarms remaining
- « true alarm »
 - 0x80000000 defaults to unsigned int per ISO-C
 - write (-2147483647-1)?

Experimental Assessment of Astrée on Safety-Critical Avionics Software, Jean Souyris, David Delmas, in proceedings of the 26th International Conference on Computer Safety, Reliability, and Security (SAFECOMP 2007), september 18-21 2007.

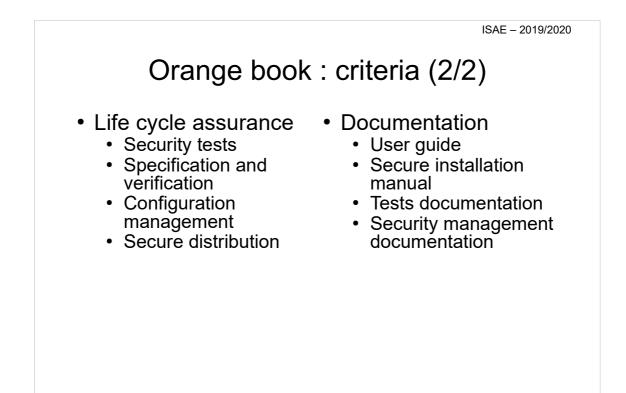

Orange book : criteria (1/2)

- Security policy
 - discretionary access control
 - Object reuse control
 - Labels
 - Mandatory access control
- Imputability (?)
 - Identification and authentication
 - · Trusted path
 - Audit

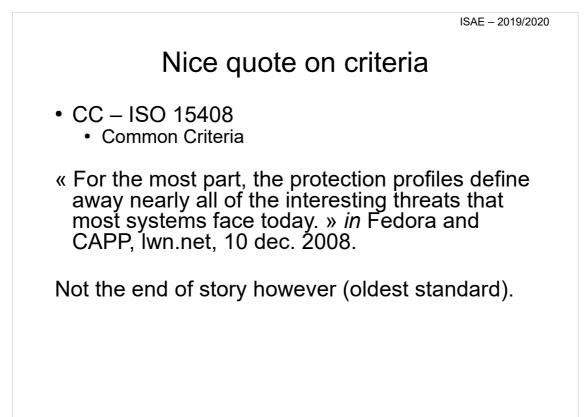

- Operational assurance
 - System architecture
 - System integrity
 - Covert channels analysis
 - Installation
 management
 - Secure recovery

ITSEC - Criteria

- Functionality classes
- Assurance Correctness : E1 to E6
- Assurance Effectiveness
 - Construction
 - Suitability of functionality
 - Binding of functionality
 - Strength of mechanisms
 - Construction vulnerability assessment
 - Operation
 - Ease of use
 - Operational vulnerability assessment

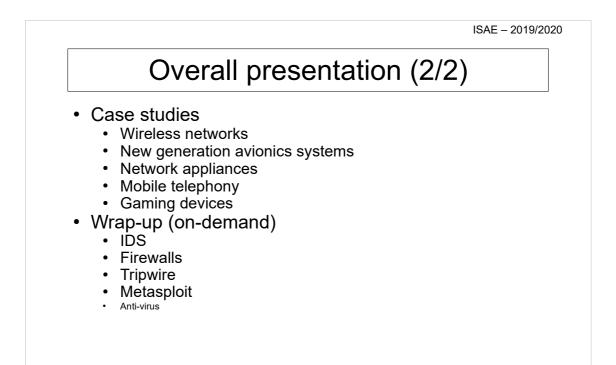

The Blowfish

- « Compared to many of the options found in Linux, unveil() is an exercise in simplicity. », J. Corbet, 767137.
- privsep +pledge():
 - stdio, rpath, wpath, inet, dns, getpw, proc, exec, ...
- Reducing ROP gadgets (RETGUARD) as (yet) another mitigation
- Only two remote holes in the default install, in a heck of a long time!
- https://man.openbsd.org/ « man man, man », D. Clar, circa 1991...
- Not even a word about pf(4) in the « security » page.

```

```

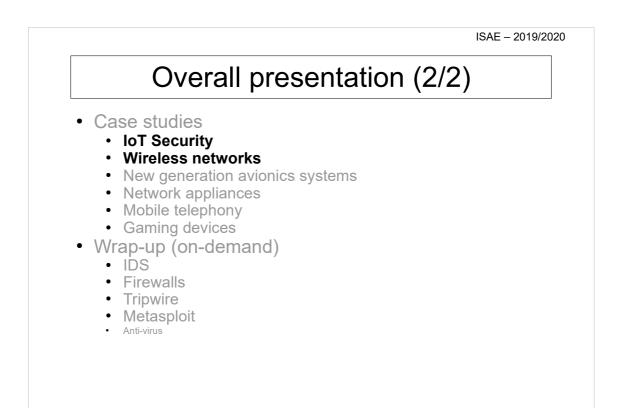

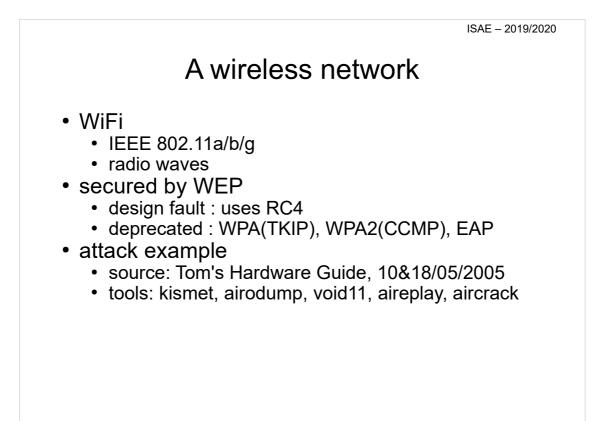

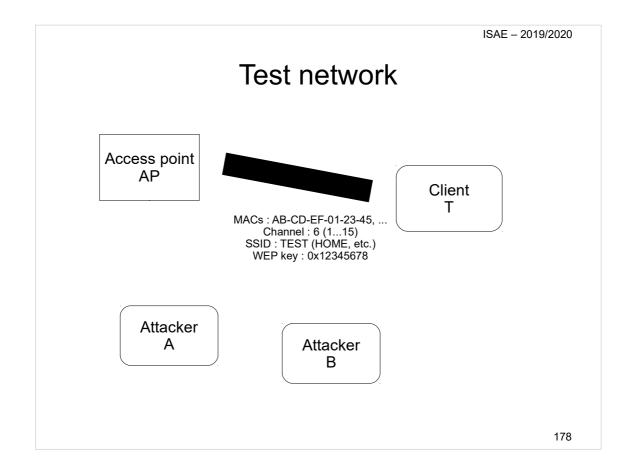

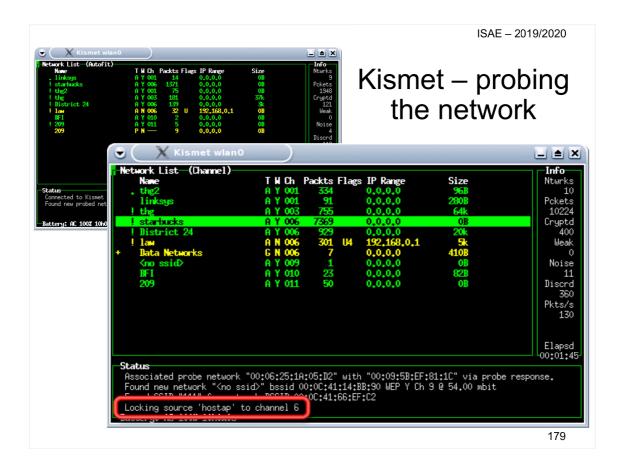

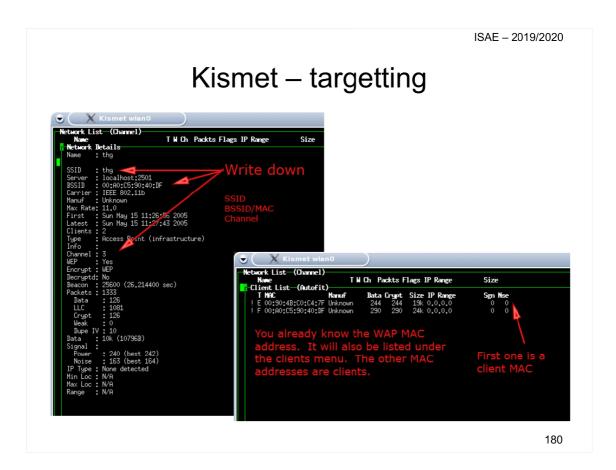

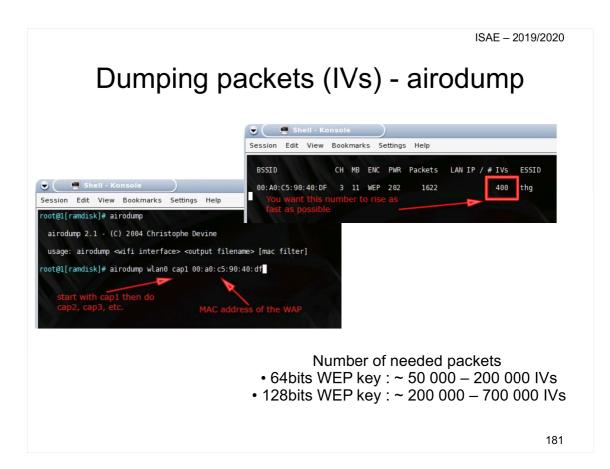

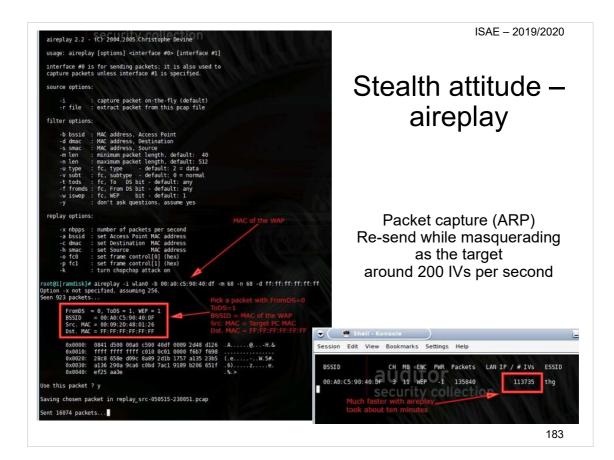

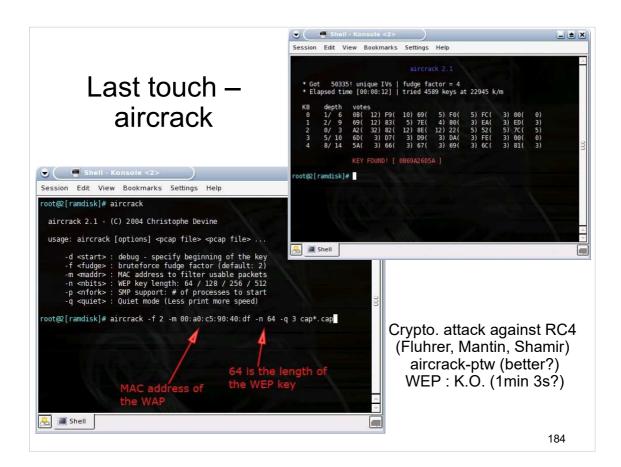

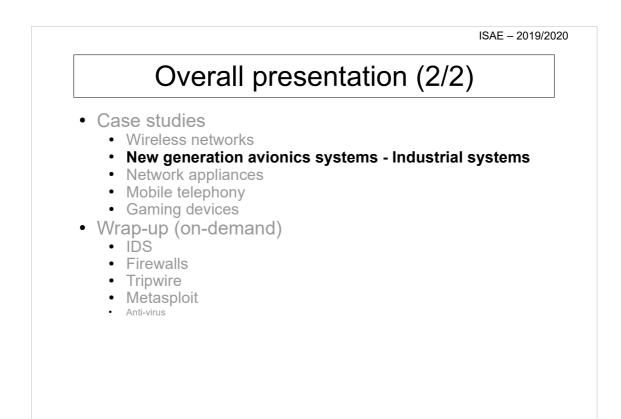

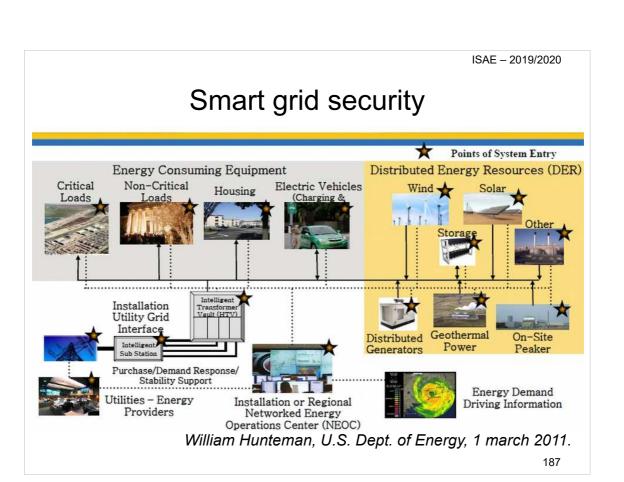

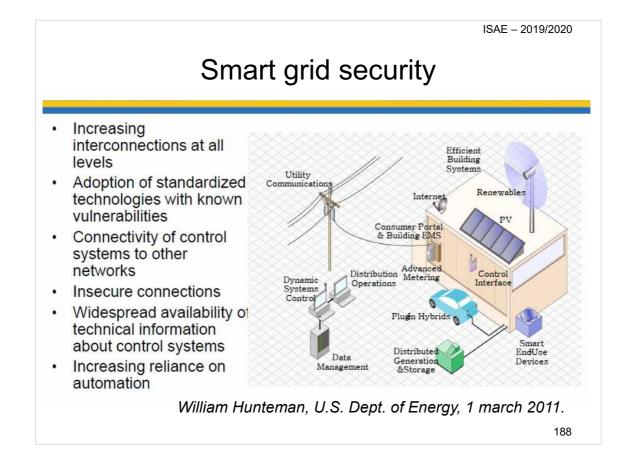

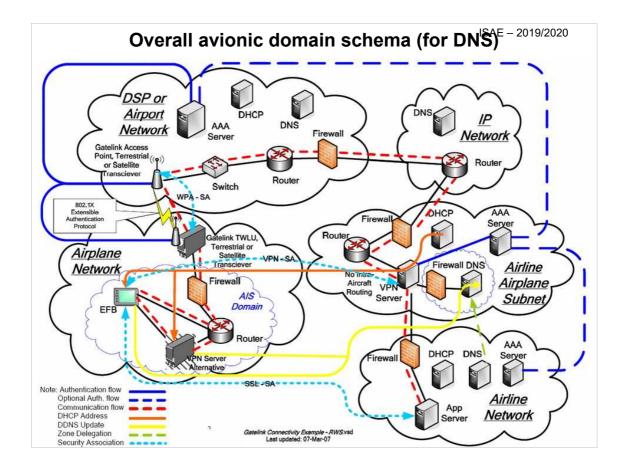

186

Other industrial systems first

- Shodan exposes SCADA systems
 - Simple web scanner for common apps.
 - www.shodanhq.com
- False Illinois Water Pump Hack Case
 - Actual system lack of security guarantees
 - A no-event in practice
 - Legitimate connection from a sub-contractor (from a russian location)
 - False assumption of SCADA hacking
 - But nobody checked with nobody
 - Finger-pointing ≠ security

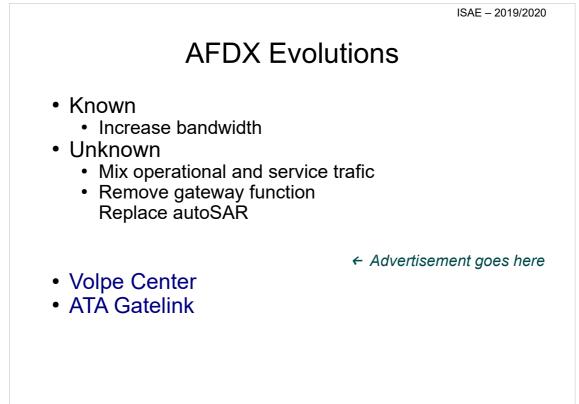

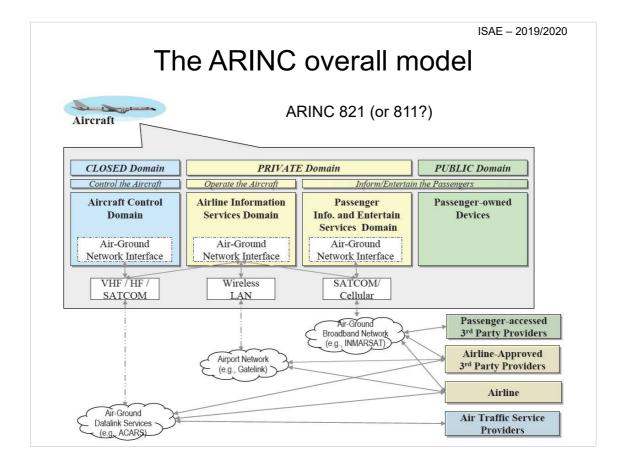

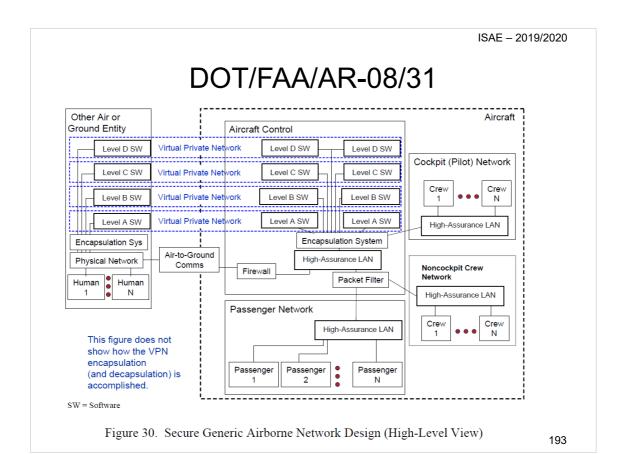

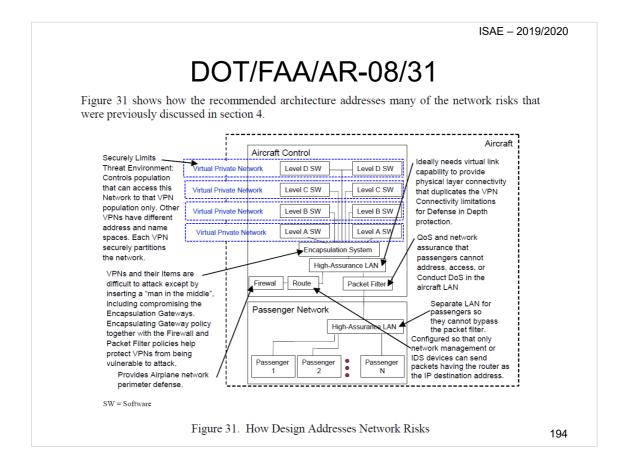

AFDX & co.

- Avionics network
 - based on Ethernet (10/100 Mb/s)
 - fully switched
 - redundancy (2x)
 - circuits available (with guaranteed transit time)
 - VL : virtual links, multicast (1 to n)
 - Statically preconfigured (including dest. port)
 - VLid : 16 bits in the MAC Dest. Adress.
 - network filtering (including over circuits)
 - or not specifically?
 - ICMP, SNMP (TCP) on-board
- Now ARINC 664 Part P

Focus on maintenance (and software upload)

- · Data loading on avionics systems
 - Uploading data and functional programs (software) from the data loader to airborne computers
 - Downloading data
 - ARINC 615
 - Uses ARINC 429 data bus for file transfers
 - ARINC 615A
 - Uses AFDX/A664 Ethernet for transfers
 - ARINC 665
 - Media set of multiple...
 - ...Loadable software parts (LSP)

Architecture components - 3

• Data modelling services

- Phases/states description language
- System and configuration description language
- Users and systems representation
- Certification-related elements
- Communication data (à la ASN.1)
- Logging data representation
- Documentation elements

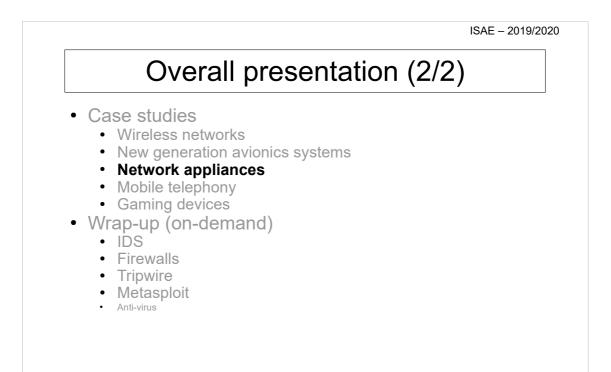

Architecture components - 5

• Miscellaneous services

- Embedded
 - Storage and internal communications (network)
 With critical communication capabilities
 - Long range external communication
 - · Configuration management
 - Physical access interfaces (and removable media)
 - Sensors
 - Positioning service
- Infrastructure
 - Positioning service support
 - Communication infrastructure(s)
 - Version management
 - Certification verification and route control authority
 - Attack simulation (?)

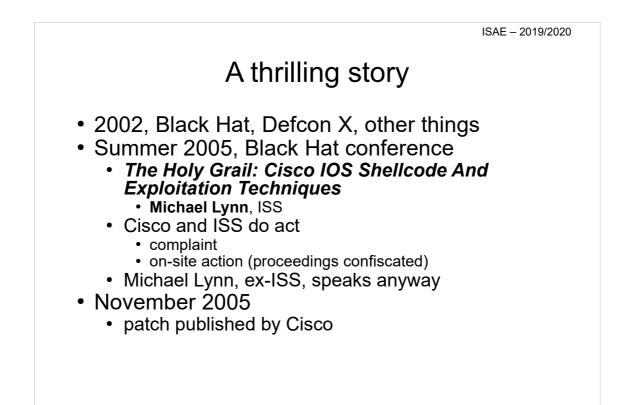

215

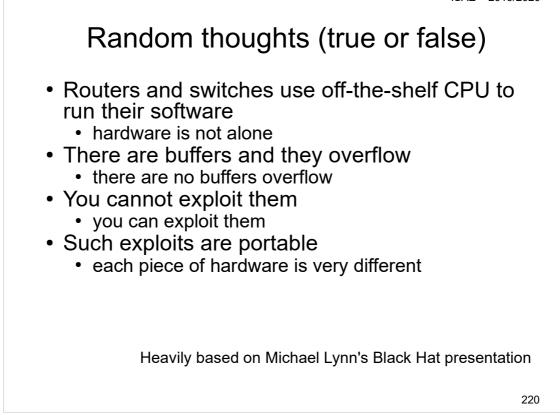

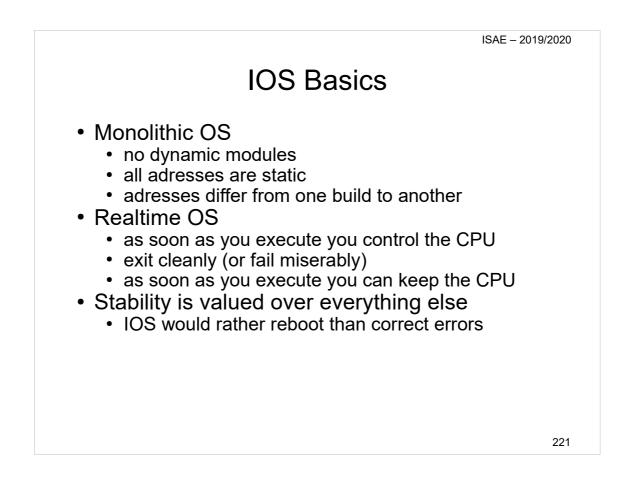

Network appliances

- A common type of embedded systems
 - routers, switches
 - ADSL boxes
 - WiFi stations
 - ...
- Cisco OS
 - PIX
 - IOS

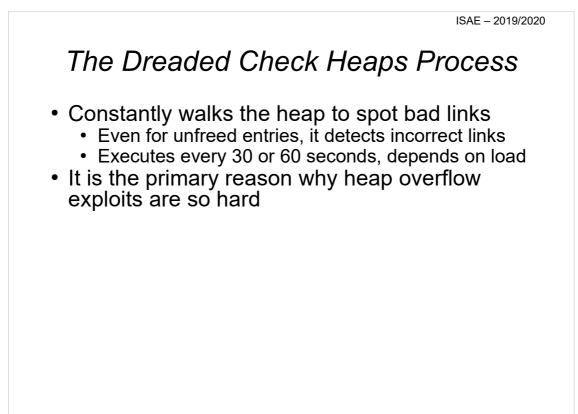

Code quality

- Much better than on other platforms
 - Heap internal integrity checks
 - Overflow runtime checks
 - · Stack is rarely used
 - A process checks heap integrity
 - Very old code, very tested
- There are still bugs
 - But you need a lot of imagination

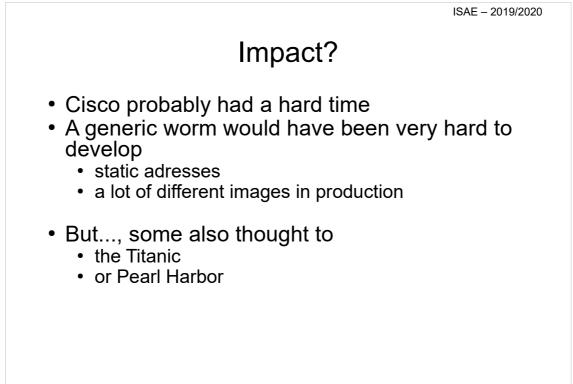

Defeating the protection

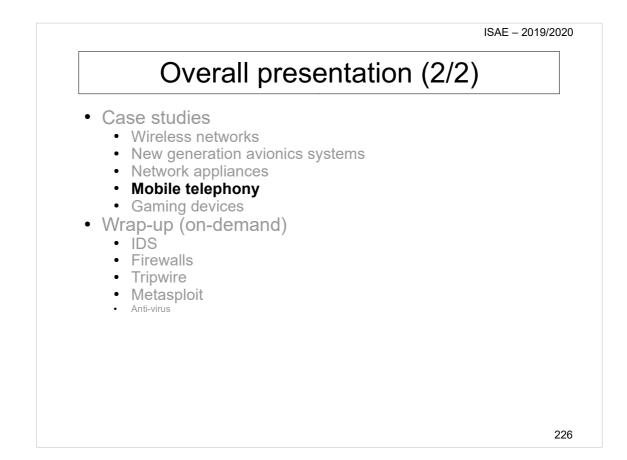

- Code dissassembly
- Lots of time and energy
- Few known tricks
 - pointers exchange
 - heap overflow

Defeating the heap check process

- Simulate a reboot (altering abort())
- a CPU watchdog will kill the heap check process
- Use the available time to complete the exploit

225

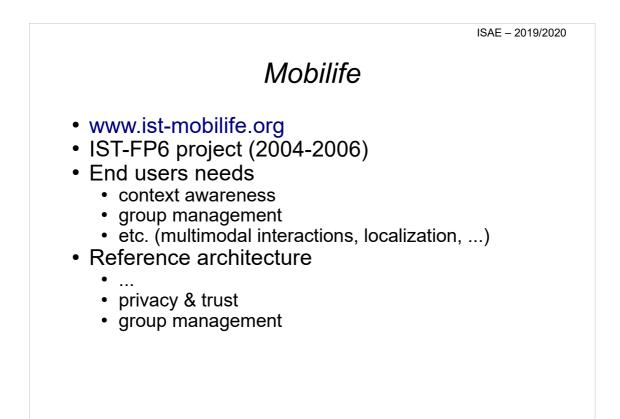

Android & the Droids

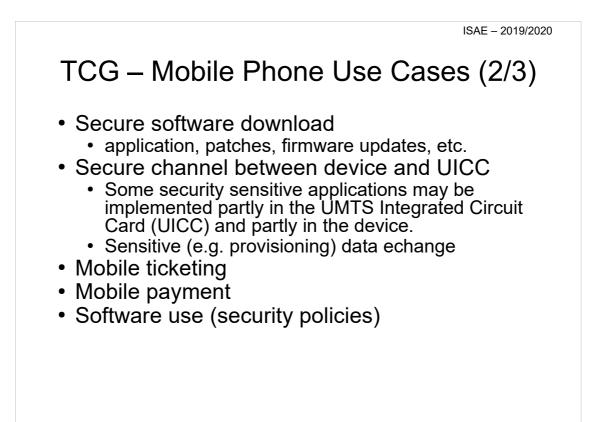

- Linux kernel-enforced sandboxing
 - Lots of « permissions » to request (refuse?)
- Application signing
 Signature level permiss
 - Signature-level permissions
- User IDs and file-access
 - 2 applications have 2 UIDs
 - and/but there is « shareUserID »
- Declaring and enforcing permissions
 - Via the androidManifest.xml
- and per-URI permissions

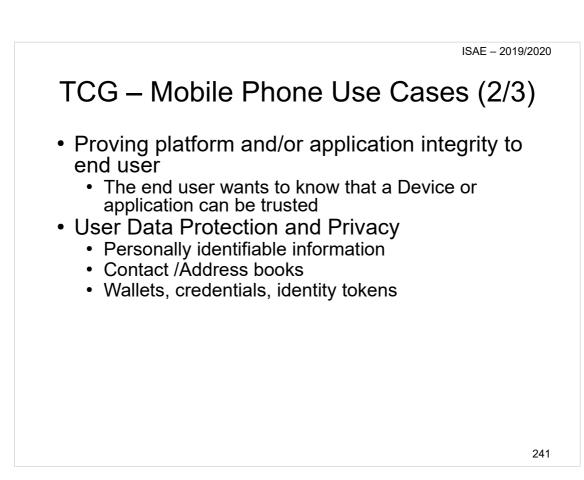

Real-world usage examples?

TCG – Mobile Phone Use Cases (1/3)

- Platform integrity
 - Devices possess and run only authorized operating systems and hardware
- Device authentication
 - to assist in user authentication (hold keys)
 - prove the identity of the device itself
- Robust DRM implementation
- SIMLock / Device Personalisation
 - device remains locked to a particular network

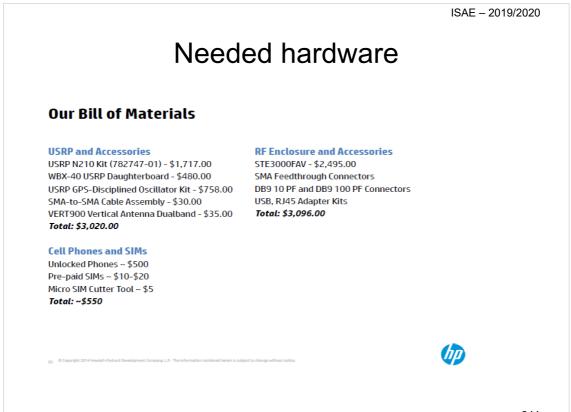

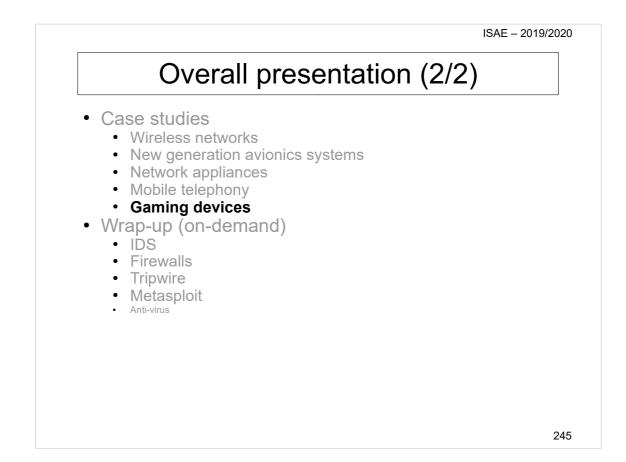

BYO SMS jamming

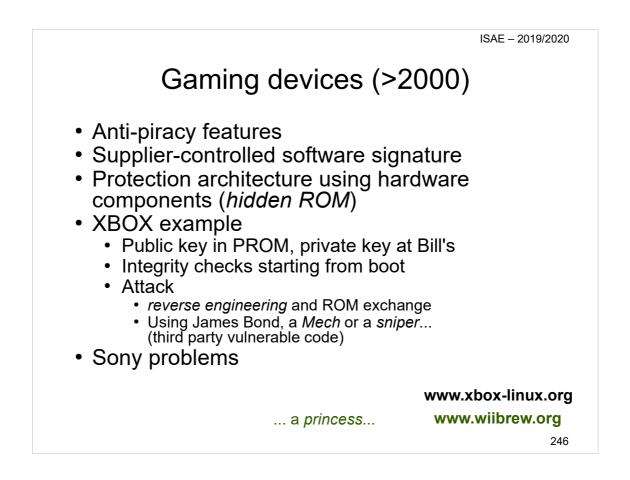

- « Blowing up the Celly »
 PacSec 2014, DEFCON 22

 - Brian Gorenc, Matt Molinyawe (HP)
- OpenBTS-based
- RF test enclosure needed
- phone == target

Next step

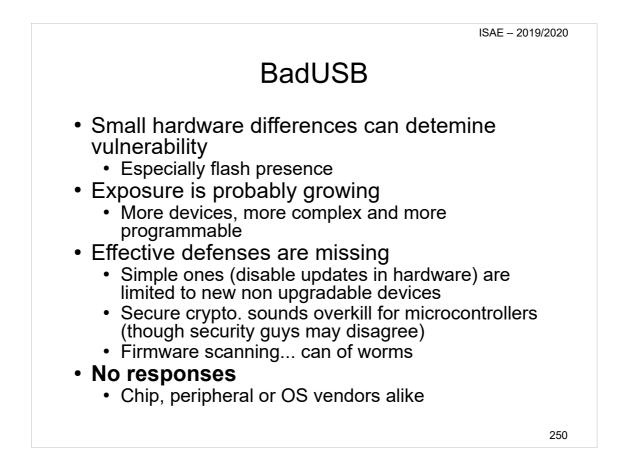

- Multilevel security policy and mandatory access control ?
 - on a gaming device?
 - on a home video recorder? (Philips, DRM)
- OpenBSD : Old style (or not)?

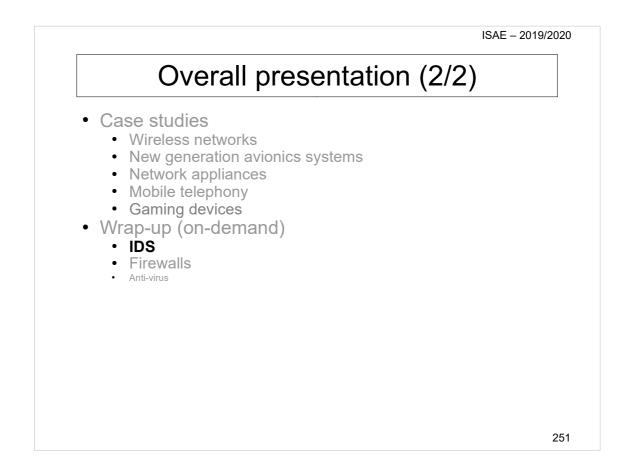

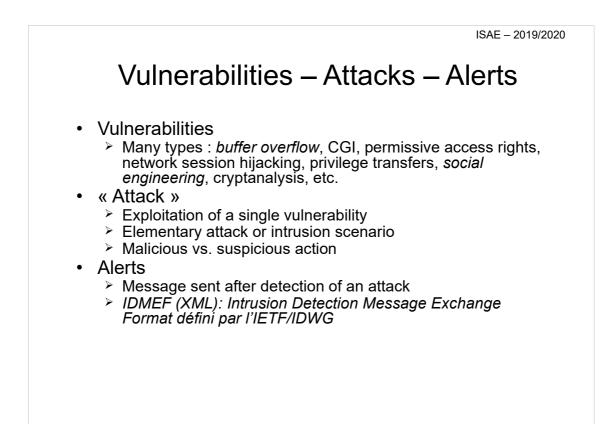

BadUSB

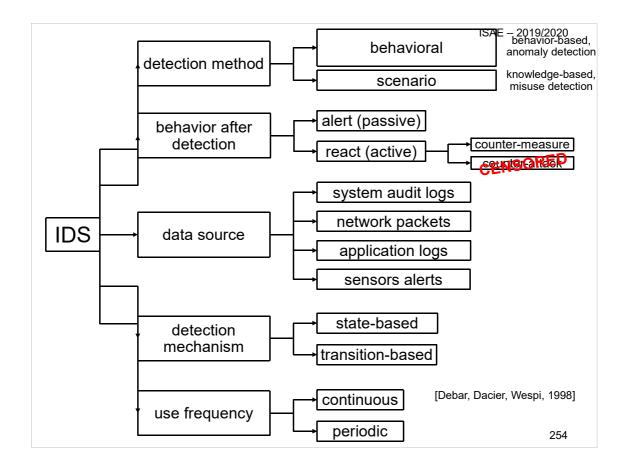

- USB devices include a micro-controller and possibly flash storage
- Large family of possible attacks
 - Emulate keyboards
 - Device deregisters then register again as a different one
 - Spoof network card
 - DHCP magic overrides DNS or default gateway
 - « USB boot-sector » virus
 - Hide data on stick of HDD
 - Rewrite data in-flight
 - Update PC BIOS
 - Spoof display

Summary	This event is generated when an incoming email containing the Klez worm is detected.			
Impact	System compromise and further infection of target hosts.			
Detailed Information	W32/Klez.h@MM exploits the vulnerability in Microsoft Internet Explorer (ver 5.01 or 5.5 without SP2), enabling it to execute email attachments.			
Once executed, it can unload several processes including Anti-virus programs. The worm is able to propagate over the network by copying itself to network shares (assu permissions exist). Target filenames are chosen randomly, and can have single or double fi				
Affected Systems	Microsoft Internet Explorer (ver 5.01 or 5.5 without SP2)			
Attack Scenarios	This virus can be considered a blended threat. It mass-mails itself to email addresses found on the local system then exploits a known vulnerability, spreads via network shares, infects executables on the local system.			
Ease of Attack	Simple. This is worm activity.			
False Positives	Certain binary file email attachments can trigger this alert.			
False Negatives	None known.			
Corrective Action	Apply the appropriate vendor suppled patches.			
	Block incoming attachments with .bat, .exe, .pif, and .scr extensions

Summary	This event is generated when an attempt is made to exploit a known vulnerablity in Microsoft RPCSS service for RPC.
Impact	Denial of Service. Possible execution of arbitrary code leading to unauthorized remote administrative access.
Detailed Information	A vulnerability exists in Microsoft RPCSS Service that handles RPC DCOM requests such that execution of arbitrary code or a Denial of Service condition can be issued against a host by sending malformed data via RPC. The Distributed Component Object Model (DCOM) handles DCOM requests sent by clients to a server using RPC. A malformed request to the host running the RPCSS service may result in a buffer overflow condition that will present the attacker with the opportunity to execute arbitrary code with the privileges of the local system account. Alternatively the attacker could also cause the RPC service to stop answering RPC requests and thus cause a Denial of Service condition to occur.
Affected Systems	Windows NT 4.0 Workstation and Server Windows NT 4.0 Terminal Server Edition Windows 2000 Windows XP

One last note...

« The final step (...) simply adds a second Trojan horse to the one that already exists. The second pattern is aimed at the C compiler. The replacement code is a (...) self-reproducing program that inserts both Trojan horses in the compiler. (...) First we compile the modified source with the normal C compiler to produce a bugged binary. We install this binary as the official C. We can now remove the bugs from the source of the compiler and the new binary will reinsert the bugs whenever it is compiled. Of course, the login command will remain bugged with no trace in source anywhere. »
